

#### Louisiana Student Standards for Science

The Louisiana Student Standards for Science were created by over eighty content experts and educators with input from parents and teachers from across the state. Educators envisioned what students should know and be able to do to compete in our communities and created standards that would allow students to do so. The Louisiana Student Standards for Science provide appropriate content for all grades or courses, maintain high expectations and create a logical connection of content across and within grades.

The Louisiana Student Standards for Science represent the knowledge and skills needed for students to successfully transition to postsecondary educations and the workplace. The standards call for students to:

- Apply content knowledge to real world phenomena and to design solutions
- Connect scientific learning to all disciplines of science
- Express ideas grounded in scientific evidence
- Demonstrate the practices of scientists and engineers

The Louisiana Student Standards do not dictate curriculum or teaching methods. Decisions about how to teach these expectations are left to local districts, schools, and teachers.

#### Structure and Components of the Standards

The Louisiana Student Standards for Science are arranged by grade levels for kindergarten through grade 8 and content areas for high school. The standards include:

- **Performance expectations** define what students should be able to do by the end of the year.
- Science and engineering practices are the practices that scientists and engineers use when investigating real world phenomena and designing solutions to problems. There are eight science and engineering practices that apply to all grade levels and content areas.
  - 1. Asking questions (science) and defining problems (engineering)
  - 2. Developing and using models
  - 3. Planning and carrying out investigations
  - 4. Analyzing and interpreting data
  - 5. Using mathematical and computational thinking
  - 6. Constructing explanations (science) and designing solutions (engineering)
  - 7. Engaging in argument with evidence
  - 8. Obtaining, evaluating, and communicating information
- **Disciplinary Core Ideas** describe the most essential ideas (content) in the major science disciplines that students will learn. Disciplinary Core Ideas are grouped into five science domains.
  - 1. Physical Science (PS)
  - 2. Life Science (LS)
  - 3. Earth and Space Science (ESS)
  - 4. Environmental Science (EVS)
  - 5. Engineering, Technology, and Applications of Science (ETS)
- **Crosscutting Concepts** are common themes that have application across all disciplines of science and allow students to connect learning within and across grade levels or content areas. The seven crosscutting concepts apply to all grade levels and content areas.
  - 1. Patterns
  - 2. Cause and effect
  - 3. Scale, proportion, and quantity
  - 4. Systems and models
  - 5. Energy and matter
  - 6. Structure and function
  - 7. Stability and change
- Clarification statements provide examples or additional explanation to the performance expectation.

#### **Interpreting Standard Codes**

Each performance expectation is identified by a code and descriptor. The coding is derived by the following formula: Grade level-Domain and Topic Number- Performance Expectation Number (space)

3-PS2-1 Motion and Stability: Forces and Interactions	The grade level is 3, the domain is Physical Science, the topic number is 2, and the performance expectation number is 1. The descriptor is, "Motion and Stability: Forces and Interactions."
7-MS-ESS2-4 Earth's Systems	The grade level is 7, the standard is middle school, the domain is Earth and Space Science, the topic number is 2, and the performance expectation is 1. The descriptor is, "Earth's Systems."
HS-LS1-1 From Molecules to Organisms: Structures and Processes	The standard is high school, the domain is Life Science, the topic number is 1, and the performance expectation number is 1. The descriptor is, "From Molecules to Organisms: Structures and Processes."

Performance Expectation	Analyze data to support the claim that Newton's second law of motion describes the mathematical relationship among the net force on a macroscopic object, its mass, and its acceleration.
Clarification Statement	<b>Physical Science:</b> Examples of data could include tables or graphs of position or velocity as a function of time for objects subject to a net unbalanced force, such as a falling object, an object rolling down a ramp, or a moving object being pulled by a constant force. Emphasis is on one-dimensional motion and macroscopic objects moving at non-relativistic speeds.
Clarification Statement	<b>Physics:</b> Examples of data could include tables or graphs of position or velocity as a function of time for objects subject to a net unbalanced force, such as a falling object, an object rolling down a ramp, or a moving object being pulled by a constant force. Emphasis is on kinematics, one-dimensional motion, two-dimensional motion, and macroscopic objects moving at non-relativistic speeds.

Science & Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
<ol> <li>Asking questions and defining problems</li> <li>Developing and using models</li> <li>Planning and carrying out investigations</li> </ol>	FORCES AND MOTION Newton's second law accurately predicts changes in the motion of macroscopic objects. (HS.PS2.A.a)	<b>CAUSE AND EFFECT</b> Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
4. <b>Analyzing and interpreting data:</b> Analyzing data in 9-12 builds on K-8 experiences and progresses to introducing more detailed statistical analysis, the comparison of data sets for consistency, and the use of models to generate and analyze data.		
<ul> <li>Analyze data using tools, technologies, and/or models (e.g., computational, mathematical) in order to make valid and reliable scientific claims or determine an optimal design solution.</li> </ul>		
5. Using mathematics and computational thinking

Simple computational simulations are created and used based on mathematical models of basic assumptions.	FORCES AND MOTION Momentum is defined for a particular frame of reference; it is the mass times the velocity of the object. In any system, total momentum is always conserved. (HS.PS2A.b) If a system interacts with objects outside itself, the total momentum of the system can change; however, any such change is balanced by changes in the momentum of objects outside the system. (HS.PS2A.c)	<b>SYSTEMS AND MODELS</b> When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
•	Use mathematical, computational, and/or algorithmic representations of phenomena or design solutions to describe and/or support claims and/or explanations.		
6.	Constructing explanations and designing solutions		
7.	Engaging in argument from evidence		
8.	Obtaining, evaluating, and communicating information		

Performance Expectation	Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision.
	<b>Physical Science:</b> Examples of evaluation and refinement could include determining the success of a device at protecting an object from damage such as, but not limited to, impact resistant packaging and modifying the design to improve it. Emphasis is on qualitative evaluations.
Clarification Statement	<b>Physics:</b> Examples of evaluation and refinement could include determining the success of the device at protecting an object from damage and modifying the design to improve it by applying the impulse-momentum theorem. Examples of a device could include a football helmet or an airbag. Emphasis is on qualitative evaluations and/or algebraic manipulations.

(HS.PS2A.c)	<b>CAUSE AND EFFECT</b> Systems can be designed to cause a desired effect.
<ul> <li>5. Using mathematics and computational thinking</li> <li>6. Constructing explanations and designing solutions: Constructing explanations (science) and designing solutions (engineering) in 9–12 builds on K-8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles, and theories.</li> <li>Design, evaluate, and/or refine a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and trade off considerations.</li> </ul>	<b>DEFINING AND DELIMITING ENGINEERING PROBLEMS</b> Criteria and constraints also include satisfying any requirements set by society, such as taking issues of risk mitigation into account, and they should be quantified to the extent possible and stated in such a way that one can tell if a given design meets them. (HS.ETS1A.a) <b>OPTIMIZING THE DESIGN SOLUTION</b> Criteria may need to be broken down into simpler ones that can be approached systematically, and decisions about the priority of certain criteria over others (trade- offs) may be needed. (HS.ETS1C.a)	
7. Engaging in argument from evidence		
8. Obtaining, evaluating, and communicating information		

3

Performance Expectation	Use mathematical representations of Newton's Law of Gravitation and Coulomb's Law to describe and predict the gravitational and electrostatic forces between objects.
<b>Clarification Statement</b>	Emphasis is on both quantitative and conceptual descriptions of gravitational and electric fields.

	Science & Engineering Practices	Disciplinary Core Ideas	<b>Crosscutting Concepts</b>
1. 2. 3. 4.	Asking questions and defining problems Developing and using models Planning and carrying out investigations Analyzing and interpreting data	<b>TYPES OF INTERACTIONS</b> Newton's Law of Universal Gravitation and Coulomb's Law provide the mathematical models to describe and predict the effects of gravitational and electrostatic forces between objects not in physical contact. (HS.PS2B.a)	<b>PATTERNS</b> Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.
5.	Using mathematics and computational thinking: Mathematical and computational thinking in 9-12 builds on K-8 experiences and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions (e.g. trigonometric, exponential and logarithmic) and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.	Forces at a distance are explained by fields (gravitational, electric, and magnetic) permeating space that can transfer energy through space. Magnets or electric currents cause magnetic fields; electric charges or changing magnetic fields cause electric fields. (HS.PS2B.b)	
•	Use mathematical, computational, and/or algorithmic representations of phenomena or design solutions to describe and/or support claims and/or explanations.		
6.	Constructing explanations and designing solutions		
7.	Engaging in argument from evidence		
8.	Obtaining, evaluating, and communicating information		

Performance Expectation	Plan and conduct an investigation to provide evidence that an electric current can produce a magnetic field and that a changing magnetic field can produce an electric current.
	<b>Physical Science:</b> Emphasis is on designing and conducting investigations including evaluating simple series and parallel circuits. Qualitative evidence is used to explain the relationship between a current-carrying wire and a magnetic compass.
<b>Clarification Statement</b>	<b>Physics:</b> Evidence of changes within a circuit can be represented numerically, graphically, or algebraically using Ohm's law. Emphasis is on designing and conducting investigations using qualitative evidence to determine the relationship between electric current and magnetic fields. Examples of evidence can include movement of a magnetic compass needle when placed in the vicinity of a current-carrying wire, and a magnet passing through a coil that turns on the light of a Faraday flashlight.

<ol> <li>Asking questions and defining problems</li> <li>Developing and using models</li> <li>Planning and carrying out investigations: Planning and carrying out investigations to answer questions (science) or test solutions (engineering) to problems in 9-12 builds on K-8 experiences and progresses to include investigations that provide evidence for and test conceptual, mathematical, physical, and empirical models.</li> <li>Plan and conduct an investigation individually and collaboratively to produce data to serve as the basis for evidence, and in the design: decide on types, how much, and accuracy of data needed to produce reliable measurements and consider limitations on the precision of the data (e.g., number of trials, cost, risk, time), and refine the design accordingly.</li> </ol>	TYPES OF INTERACTIONS Forces that act over a distance are explained by fields (gravitational, electric, and magnetic) permeating space that can transfer energy through space. Magnets or electric currents cause magnetic fields; electric charges or changing magnetic fields cause electric fields. (HS.PS2B.b) <b>DEFINITIONS OF ENERGY</b> "Electrical energy" may mean energy stored in a battery or energy transmitted by electric currents. (HS.PS3A.d)	<b>CAUSE AND EFFECT</b> Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
<ol> <li>Analyzing and interpreting data</li> <li>Using mathematics and computational thinking</li> <li>6. Constructing explanations and designing solutions</li> <li>Engaging in argument from evidence</li> <li>Obtaining, evaluating, and communicating information</li> </ol>		

#### ENERGY

Performance Expectation	Create a computational model to calculate the change in the energy change in energy of the other component(s) and energy flows in and	of one component in a system when the out of the system are known.
Clarification Statement	<b>Chemistry:</b> Emphasis is on explaining the meaning of mathematical basic algebraic expression or computations, systems of two or three <b>Physics:</b> Emphasis is on explaining the meaning of mathematical explagebraic expression or computations; systems of two or three comp	expressions used in the model. Focus is on components, and thermal energy. pressions used in the model. Focus is on basic ponents; and thermal energy, kinetic energy,
	and/or the energies in gravitational, magnetic, or electric netus.	
Science & Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
<ol> <li>Asking questions and defining problems</li> <li>Developing and using models</li> <li>Planning and carrying out investigations</li> <li>Analyzing and interpreting data</li> <li>Using mathematics and computational thinking: Mathematical and computational thinking in 9-12 builds on K-8 experiences and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions (e.g. trigonometric, exponential and logarithmic) and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.</li> </ol>	DEFINITIONS OF ENERGY Energy is a quantitative property of a system that depends on the motion and interactions of matter and radiation within that system. That there is a single quantity called energy is due to the fact that a system's total energy is conserved, even as, within the system, energy is continually transferred from one object to another and between its various possible forms. (HS.PS3A.a) CONSERVATION OF ENERGY AND ENERGY TRANSFER Conservation of energy means that the total change of energy in any system is always equal to the total energy transferred into or out of the system. (HS.PS3B.a) Energy cannot be created or destroyed, but it can be transported from one place to another and transferred between systems. (HS.PS3B.b)	<b>SYSTEMS AND MODELS</b> Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.
<ul> <li>Create and/or revise a computational model or simulation of a phenomenon, designed device, process, or system.</li> <li>Constructing explanations and designing solutions</li> <li>Engaging in argument from evidence</li> <li>Obtaining, evaluating, and communicating information</li> </ul>	Mathematical expressions allow the concept of conservation of energy to be used to predict and describe system behavior. These expressions quantify how the stored energy in a system depends on its configuration (e.g. relative positions of charged particles, compression of a spring) and how kinetic energy depends on mass and velocity. (HS.PS3B.c) The availability of energy limits what can occur in any system. (HS.PS3B.d)	

### ENERGY

Performance Expectation	Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative positions of particles (objects)
<b>Clarification Statement</b>	<b>Physical Science:</b> Examples of phenomena at the macroscopic scale could include the conversion of potential energy to kinetic and thermal energy. Examples of models could include diagrams, drawings, descriptions, and computer simulations.
	<b>Physics:</b> Examples of phenomena at the macroscopic scale could include the conversion of potential energy to kinetic and thermal energy, and the energy stored between two electrically-charged plates. Examples of models could include diagrams, drawings, descriptions, and computer simulations.

	Science & Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
1. 2.	Asking questions and defining problems <b>Developing and using models:</b> Modeling in 9-12 builds on K-8 experiences and progresses to using, synthesizing, and developing models to predict and show relationships among variables between systems and their components in the natural and designed world(s)	<b>DEFINITIONS OF ENERGY</b> Energy is a quantitative property of a system that depends on the motion and interactions of matter and radiation within that system. There is a single quantity called energy. A system's total energy is conserved, even as, within the system, energy is continually transferred from one object to another and between its various possible forms (HS PS3A a)	<b>ENERGY AND MATTER</b> Energy cannot be created or destroyed—it only moves between one place and another place, between objects and/or fields, or between systems.
•	Develop, revise, and/or use a model based on evidence to illustrate and/or predict the relationships between systems or between components of a system.	At the macroscopic scale, energy manifests itself in multiple ways, such as in motion, sound, light, and thermal energy (HS PS34 b)
