

## 2018-2019 LEAP 2025 High School Operational Technical Report

English I, English II, Algebra I, and Geometry

Submitted to the<br>Louisiana Department of Education

November 2019

This online-only document was published at a cost of $\$ 33,533$. This document was published for the Louisiana Department of Education, P.O. Box 94064, Baton Rouge, LA 70804-9064, by Data Recognition Corporation, 13490 Bass Lake Road, Maple Grove, MN 55311. This material was printed in accordance with the standards for printing by
State Agencies established pursuant to R.S. 43:31.

## Table of Contents

Executive Summary ..... 5
E. 1 Overview of This Report ..... 5
E. 2 Administration. ..... 6
E. 3 Student Performance ..... 7
E. 4 Validity and Test Scores ..... 7
Chapter 1: Introduction ..... 8
1.1 Background ..... 8
1.2 Purpose of the LEAP 2025 ..... 8
1.3 Design of the LEAP 2025 ..... 8
Chapter 2: The Uses of Test Scores ..... 11
2.1 Uses of Test Scores ..... 11
2.2 Test-Level Scores ..... 11
2.3 Scale Scores ..... 12
2.4 Levels of Achievement ..... 12
2.5 Use of Test-Level Scores ..... 12
2.6 Category- and Subcategory-Level Subscores ..... 12
2.7 Use of the Category- and Subcategory-Level Ratings ..... 13
Chapter 3: Test Content Development ..... 14
3.1 Defining the Specific Test Blueprint ..... 16
3.2 Louisiana Item Development and Item Review ..... 33
3.3 Guidelines on Bias, Fairness, and Sensitivity ..... 36
3.3 Operational Test Selection ..... 37
3.4 Universal Design ..... 43
3.5 Accommodations and Designated Supports ..... 44
3.6 Item and Task Specifications ..... 46
3.7 Summary ..... 46
Chapter 4: Test Administration. ..... 48
4.1 Return Material Forms and Guidelines ..... 52
4.2 Security Checklists ..... 53
4.3 Interpretive Guides ..... 53
4.4 Test Security Measures ..... 53
4.5 Test Administration ..... 54
4.6 Summary ..... 60
Chapter 5: Scoring of Constructed-Response and Technology-Enhanced Items ..... 62
5.1 Constructed-Response Item Scoring Process ..... 62
5.2 Inter-Rater Reliability ..... 71
5.3 Technology-Enhanced Item Scoring Process ..... 84
5.4 Multiple-Choice and Multiple-Select Item Scoring Process ..... 85
5.5 Summary ..... 85
Chapter 6: Operational Data Analyses ..... 86
6.1 Classical Item Statistics ..... 86
6.2 Calibration Sample ..... 91
6.3 Calibration and Linking ..... 96
6.4 Comparability: Form Equating ..... 113
6.5 Summary ..... 119
Chapter 7: Test Results ..... 121
7.1 Student Participation ..... 121
7.2 Reports ..... 143
7.3 Description of Each Type of Report ..... 144
7.4 Summary ..... 145
Chapter 8: Performance-Level Setting ..... 146
8.1 PARCC Performance-Level Setting Process for English Language Arts and Mathematics ..... 146
8.2 Cut Scores. ..... 146
8.3 Category Cut Scores ..... 147
8.4 Achievement-Level Definitions ..... 147
8.5 Summary ..... 147
Chapter 9: Evidence of Construct-Related Validity ..... 149
9.1 Construct-Irrelevant Variance and Construct Underrepresentation ..... 150
9.2 Reliability ..... 150
9.3 Test Reliability ..... 151
9.4 Standard Error of Measurement ..... 152
9.5 Conditional Standard Error of Measurement ..... 153
9.6 Classification Accuracy and Consistency ..... 156
9.7 Convergent Validity ..... 159
9.8 Principal Components Analysis ..... 159
9.9 Analyses by Reporting Categories and Subcategories ..... 162
9.10 Correlations among Reporting Categories and Subcategories ..... 162
9.11 Reliability of Reporting Categories, or Subcategories ..... 167
9.12 Standard Error of Measurement of Reporting Categories or Subcategories. ..... 167
9.13 Divergent (Discriminant) Validity ..... 171
9.14 Summary ..... 172
Chapter 10: Fairness ..... 173
10.1 Minimizing Bias through Careful Test Development ..... 174
10.2 Evaluating Bias through Differential Item Functioning (DIF) Statistics ..... 174
10.3 Evaluating Bias through Impact Analysis. ..... 183
10.4 Reliability ..... 183
10.5 Effect Size ..... 192
10.6 Summary ..... 210
Appendix A-Text Complexity Placemat Template ..... 211
Appendix B—Item Content and Bias Review ..... 212
Appendix C—Accommodated Print Form Creation ..... 219
Appendix D—Item Alignment Review Process ..... 221
Appendix E—Transadaptation Process for Spanish Mathematics Forms. ..... 224
Appendix F—LEAP 2025 Spring 2019 Handscoring/AI Documentation ..... 226
Appendix G—Classical Item Statistics ..... 307
Appendix H—Student Participation Counts. ..... 323
References ..... 339

## Executive Summary

This report is a technical summary of the 2018-2019 administrations of the Louisiana Educational Assessment Program (LEAP 2025) in English Language Arts (ELA) and mathematics for high school. The LEAP 2025 is a summative assessment in ELA and Mathematics administered in grades 3 through 8 and high school. These tests are designed to measure students' readiness for the next grade or course of study and proficiency in ELA and mathematics. The ELA and mathematics test forms were developed by Data Recognition Corporation (DRC) test development staff using the Partnership for Assessment of Readiness for College and Careers (PARCC) consortium's item bank as well as items from the Louisiana Department of Education's own item bank. Items taken from these banks were on pre-established item response theory (IRT) scales. This section provides a summary of the 2018-2019 operational technical report.

## E. 1 Overview of This Report

This technical report documents the major activities of the testing cycle and provides details that confirm that the processes and procedures applied in the LEAP 2025 assessments adhered to appropriate professional standards and practices of educational assessment. Ultimately, this report serves to document evidence that valid inferences about Louisiana student performance in ELA and mathematics can be derived from the LEAP 2025 assessments. An overview of major activities documented within this report is provided below.

## The Uses of Test Scores (Chapter 2)

Chapter 2 of the technical report discusses the concept of validity evidence. This technical report is composed of evidence that supports the intended uses of the LEAP 2025 test scores, and Chapter 2 discusses some of those uses.

## Test Content Development (Chapter 3)

Chapter 3 of the technical report provides a summary of the test development activities that occurred to create the 2018-2019 operational test forms.

## Test Administration (Chapter 4)

Chapter 4 of the technical report describes the processes implemented and the information disseminated to help ensure standardized test administration procedures and, thus, uniform test administration conditions for students.

## Constructed-Response and Technology-Enhanced Scoring (Chapter 5)

Chapter 5 of the technical report describes the processes used to score constructed-response and technology-enhanced items. This chapter discusses how scorers are trained and the measures used to ensure consistency among scorers. Finally, this chapter presents the results of the inter-rater reliability studies.

## Operational Data Analyses (Chapter 6)

Chapter 6 of the technical report includes a detailed description of the operational data analyses of the 2018-2019 LEAP 2025 ELA and mathematics assessments, which include the following major parts: the classical item analysis; calibration, scaling, and linking using IRT models; and student scoring. This chapter also describes the demographics of the calibration samples and compares them to state census data. It reports the results of the classical item analysis and the results of the calibration, scaling, and linking processes.

## Test Results (Chapter 7)

Chapter 7 of the technical report contains information on the results of the 2018-2019 LEAP 2025 assessments. Detailed summary statistics based on scale scores and achievement-levels are also provided. Finally, this chapter presents information on the score reports sent to school systems.

## Performance-Level Setting (Chapter 8)

Chapter 8 of the technical report briefly discusses performance-level setting. It provides a brief overview of the PARCC procedures for performance-level setting and for derivation of the cut scores used to classify students into achievement levels for ELA and mathematics.

## Evidence of Construct-Related Reliability (Chapter 9)

Chapter 9 of the technical report provides evidence of the reliability and validity of the LEAP 2025 test scores. This chapter provides detailed evidence of the reliability of the tests and information on the decision consistency of the cut scores. It also provides evidence of construct validity for the LEAP 2025 test scores.

## Fairness (Chapter 10)

Chapter 10 of the technical report discusses fairness and how the LEAP 2025 assessments are constructed to be fair to all Louisiana students. This chapter summarizes the results of the differential item functioning (DIF) analysis. It also discusses the results of an impact analysis designed to determine whether large differences exist within the test results of different demographic groups in Louisiana. The results of the administration mode study are also summarized.

## E. 2 Administration

Louisiana administered the LEAP 2025 summative assessments in ELA and mathematics to high school students in 2018-2019. Computer-based tests (CBT) were administered during the following three testing windows: November 28 through December 14, 2018; April 15 through May 17, 2019; and June 17-21, 2019. Test administration is discussed in Chapter 4 of this report.

Ninety-eight school systems and twenty-six charter schools administered the ELA and mathematics LEAP 2025 high school tests across the three administrations.

## E. 3 Student Performance

Table E. 1 presents the percentage of students in 2018-2019 who were classified in each of the achievement levels for each subject. In general students that make up the population for each administration are:

- Fall: students from schools with block schedules and students retesting
- Spring: students from schools with block and regular schedules, as well as students retesting
- Summer: primarily students retesting

Table E. 1 Percentage of Students Classified in Achievement Levels Using 2018-2019 Census Data: English Language Arts and Mathematics

| Administration | Subject | Unsatisfactory | Approaching Basic | Basic | Mastery | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Fall | English I | 23.8 | 20.9 | 21.2 | 27.3 | 6.9 |
|  | English II | 34.9 | 21.0 | 17.0 | 19.0 | 8.1 |
|  | Algebra I | 20.8 | 36.8 | 19.7 | 21.1 | 1.6 |
|  | Geometry | 11.8 | 29.4 | 28.5 | 26.5 | 3.9 |
| Spring | English I | 12.4 | 18.5 | 26.7 | 34.5 | 8.0 |
|  | English II | 18.4 | 16.3 | 20.5 | 32.3 | 12.5 |
|  | Algebra I | 11.0 | 23.5 | 28.4 | 32.7 | 4.4 |
|  | Geometry | 4.8 | 28.0 | 34.0 | 28.1 | 5.1 |
| Summer | English I | 53.2 | 36.5 | 9.1 | 1.2 | 0.0 |
|  | English II | 69.0 | 23.0 | 6.7 | 1.2 | 0.2 |
|  | Algebra I | 32.8 | 46.2 | 18.3 | 2.7 | 0.0 |
|  | Geometry | 33.5 | 51.6 | 7.6 | 2.2 | 5.1 |

More information on student performance may be found in Chapter 7 of this report.

## E. 4 Validity and Test Scores

Most sections of this technical report are designed to provide validity evidence to support the use of the LEAP 2025 test scores. Chapter 2 discusses the uses of the LEAP 2025 test scores. Chapter 3 discusses the test development process used to create the LEAP 2025 tests, which is important to the content-related validity of the LEAP 2025 test scores. Chapter 4 presents information on test administration. Chapter 5 discusses the scoring process and the results of the inter-rater reliability studies. Chapter 6 presents the test scaling and linking procedures, student scoring methodology, and the results of other operational data analyses. Chapter 7 reviews the results of the 2018-2019 administrations and gives an overview of the score reports that were electronically delivered to the school systems for distribution to schools and parents. Chapter 8 highlights the procedures for performance-level setting implemented by PARCC, which were used because PARCC's standards and achievement levels were used for the LEAP 2025. Chapter 9 discusses reliability and constructrelated validity. Chapter 10 gives an overview of the statistical processes used to evaluate bias to ensure the fairness of the LEAP 2025 for all examinees.

## Chapter 1: Introduction

The LEAP 2025 assessment system is designed to measure students' knowledge of ELA, mathematics, science, and social studies. This report provides a technical overview of the LEAP 2025 ELA and Mathematics high school assessments administered in the 2018-2019 academic year and presents evidence for the validity of the 2018-2019 LEAP 2025 ELA and mathematics high school assessment scores.

This chapter describes the background, purpose, and design of the LEAP 2025 assessments.

### 1.1 Background

In 2010, the Board of Elementary and Secondary Education (BESE) approved the Common Core State Standards (CCSS) in ELA and mathematics. After adopting the CCSS, Louisiana became a governing member of PARCC, a group of states working to develop high-quality assessments that measure the full range of the CCSS. Beginning in 2015, students in grades 3-8 began taking these newly aligned assessments.

In 2016, Louisiana ELA and mathematics academic content standards underwent a review process resulting in the adoption of the Louisiana Student Standards in English language arts and mathematics. In spring 2017, ELA and mathematics students in grades 3-8, except those qualifying for the LEAP Alternate Assessment Level 1 (LAA 1), took the LEAP 2025 assessments.

Beginning in the 2017-2018 school year, the Louisiana Department of Education (LDOE) transitioned to LEAP 2025 ELA and mathematics high school assessments, which were aligned to the Louisiana Student Standards in ELA and mathematics. The five-performance-level LEAP 2025 high school assessments replaced the four-performance-level End-of-Course (EOC) tests. Students enrolled in English I, English II, Algebra I, and Geometry in grades 9-12 took the LEAP 2025 high school assessments.

The information that follows describes the technical aspects of the 2018-2019 LEAP 2025 ELA and Mathematics assessments and provides information about how to read and interpret the data on the 20182019 assessment reports.

### 1.2 Purpose of the LEAP 2025

The BESE and the LDOE are committed to ensuring that every student is on track to be successful in either postsecondary education or the workforce through their comprehensive plan Louisiana Believes. The LEAP 2025 supports this vision by measuring the full range of student performance, including the performance of high- and low-performing students, and providing information for educators and parents about student readiness for college and careers.

### 1.3 Design of the LEAP 2025

High school students were administered computer-based tests (CBTs) in both ELA and mathematics. Additionally, a braille form was available for each course and content area. Online tools allowed students to magnify assessment items as needed. See Section 3.5 in Chapter 3 for more information about the accommodations and designated supports available for students taking the LEAP 2025. All mathematics assessments were translated into Spanish forms.

The operational blueprints for the PARCC flagship form are the basis of the design of the 2018-2019 LEAP 2025 test blueprints and test design. The 2018-2019 LEAP 2025 test blueprints and test design for ELA and mathematics differ from the PARCC blueprints and design in order to reduce testing time while maintaining full coverage and including a variety of standards.

The 2018-2019 LEAP 2025 ELA blueprints kept a similar design as the design of PARCC's flagship form, including both performance-based tasks and stand-alone passage sets; however, only two of the three types of performance tasks—Research Simulation Task (RST) and Literary Analysis Task (LAT) or Narrative Writing Task (NWT) —are included on each of the LEAP 2025 English I and English II assessments. All three task types are represented across administrations, which encourages teachers to focus equally on all three writing types. Besides having two (instead of three) performance tasks, the 2018-2019 LEAP 2025 ELA blueprints are also different from the PARCC blueprint with respect to testing time and percentage of reading and writing points. Since the choice of Literary Analysis Task or Narrative Writing Task is determined during the forms construction process, alternative blueprints—one with a Literary Analysis Task and a Research Simulation Task and the other with a Research Simulation Task and a Narrative Writing Task—were created for each course's assessment.

The passages chosen for the 2018-2019 LEAP 2025 English I and English II assessments contain a variety of texts of different genres with a balance of authors by gender and ethnicity. The assessments also contain texts that appeal to a diverse student population. Chosen passages are authentic and contain a variety of different types of text with varying degrees of text complexity. They are rich in content, engaging, highquality, and challenging. Additionally, paired passages are selected with careful consideration of the standards that require the use of more than one text. This combination of criteria during passage selection allows students to demonstrate their ability to read and comprehend a range of complex texts and helps ensure as much coverage of the standards as possible.

The LEAP 2025 ELA assessments focus on an integrated approach to reading and writing that reflects instruction in an effective ELA classroom and measures students' ability to understand what they read and express that understanding in writing. This means careful, close reading of complex grade-level literary and informational texts; a full range of texts from across the disciplines, including science, social studies, and the arts; tasks that integrate key ELA skills by asking students to read texts, answer reading and vocabulary questions about the texts, and then write using evidence from what they have read; questions worth answering, ordered in a way that builds meaning; a focus on students citing evidence from texts when answering questions about a specific passage or when writing about a set of related passages; and a focus on words that matter most in texts, that are essential to understanding a particular text, and that include context that allows students to determine literal and figurative meanings.

The 2018-2019 LEAP 2025 mathematics blueprints kept a similar design as the design of PARCC's flagship form, with a few notable exceptions:

- Both LEAP 2025 and PARCC have three sessions, with Session 1 split into non-calculator and calculator sections. However, PARCC has three sessions that last 90 minutes each (for a total of 270 minutes), while LEAP 2025 has three sessions that last 80 minutes each (for a total of 240 minutes).
- In Algebra I, PARCC and LEAP 2025 have the same number of Type II items worth 4 points. The LEAP 2025 design uses 1 more Type I item worth 1 point, 2 fewer Type I items worth 2 points, 1 fewer Type I item worth 4 points, 1 fewer Type II item worth 3 points, 1 more Type III item worth 3 points, and 1 fewer Type III item worth 6 points.
- In Geometry, PARCC and LEAP 2025 have the same number of Type II items worth 4 points. The LEAP 2025 design uses 1 fewer Type I item worth 1 point, 1 fewer Type I item worth 2 points, 1 fewer Type I item worth 4 points, 1 fewer Type II item worth 3 points, 1 more Type III item worth 3 points, and 1 fewer Type III item worth 6 points.

The LEAP 2025 mathematics assessments focus on testing the Louisiana Student Standards for Mathematics (LSSM) according to the components of rigor reflected in high-quality mathematics instructional tasks that

- require students to demonstrate understanding of mathematical reasoning in mathematical and applied contexts;
- assess accurate, efficient, and flexible application of procedures and algorithms;
- rely on application of procedural skill and fluency to solve complex problems; and
- require students to demonstrate mathematical reasoning and modeling in real-world contexts.

The LSSM support students in becoming mathematically proficient by focusing on three components of rigor: conceptual understanding, procedural skill and fluency, and application.

- Conceptual understanding refers to understanding mathematical concepts, operations, and relations. It is more than knowing isolated facts and methods. Students should be able to make sense of why a mathematical idea is important and the kinds of contexts in which it is useful. It also allows students to connect prior knowledge to new ideas and concepts.
- Procedural skill and fluency is the ability to apply procedures accurately, efficiently, and flexibly. It requires speed and accuracy in calculation while giving students opportunities to practice basic skills. Students' ability to solve more complex application tasks is dependent on procedural skill and fluency.
- Application provides a valuable context for learning and solving problems in a relevant and meaningful way. It is through real-world application that students learn to select an efficient method to find a solution, determine whether the solution(s) makes sense by reasoning, and develop critical thinking skills.

Each item on the LEAP 2025 Algebra I and Geometry assessments is referred to as a task and is identified by one of three types: Type I, Type II, or Type III. The tasks on the LEAP 2025 mathematics tests are aligned directly to the LSSM for all reporting categories.

- Type I tasks, designed to assess conceptual understanding, fluency, and application, are aligned to the major, additional, and supporting content for each grade. Some Type I tasks may be further aligned to LEAP 2025 evidence statements for the Major Content and Additional \& Supporting reporting categories and allow for the testing of more than one LSSM on a single task.
- Type II tasks are designed to assess student reasoning ability of selected major content for the grade or the previous grade in applied contexts. Type II tasks are further aligned to LEAP 2025 evidence statements for the Expressing Mathematical Reasoning and Modeling \& Application reporting categories.
- Type III tasks are designed to assess student modeling ability of selected content for the grade or the previous grade in applied contexts. Type III tasks are further aligned to LEAP 2025 evidence statements for the Expressing Mathematical Reasoning and Modeling \& Application reporting categories.

Each of the three task types is aligned to one of four reporting categories: Major Content, Additional \& Supporting Content, Expressing Mathematical Reasoning, or Modeling \& Application. Each task type is designed to align with at least one of the Louisiana Student Standards for Mathematical Practice (MP).

Additional details about the design of the ELA and mathematics assessments can be found in Chapter 3.

## Chapter 2: The Uses of Test Scores

Validity is the central component of the LEAP 2025 assessments. The following excerpt is from the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014):

Ultimately, the validity of an intended interpretation of test scores relies on all the available evidence relevant to the technical quality of a testing system. Different components of validity evidence . . . include evidence of careful test construction; adequate score reliability; appropriate test administration and scoring; accurate score scaling, equating, and standard setting; and careful attention to fairness for all test takers, as appropriate to the test interpretation in question. (22)

As stated by the Standards, the validity of a testing program hinges on the use of the test scores. Validity evidence that supports the use of the LEAP 2025 test scores is provided in this technical report. This chapter examines some possible uses of the LEAP 2025 test scores. However, this technical report cannot anticipate all possible interpretations and uses of the LEAP 2025 test scores.

### 2.1 Uses of Test Scores

To understand whether a test score is being used properly, one must understand the purpose of the test. The intended uses of the LEAP 2025 test scores include the following:

- evaluating students' overall proficiency of the Louisiana Student Standards
- identifying students' strengths and weaknesses
- evaluating programs at the school, school system, and/or state level
- informing stakeholders, including students, teachers, school administrators, school system administrators, LDOE staff members, parents, and the public, of the status of students' progress toward meeting college- and career- readiness standards

This technical report refers to the uses of test-level scores (i.e., scale scores and achievement levels), category-level scores and achievement-level classifications, and subcategory-level scores and achievementlevel classifications.

### 2.2 Test-Level Scores

At the test level, an overall scale score that is based on student performance on the entire test is reported. In addition, an associated level of achievement is reported. These scores and achievement levels indicate, in varying ways, a student's achievement. Test-level scores are reported at four reporting levels: the state, the school system, the school, and the student.

The LEAP 2025 high school ELA and mathematics test forms were developed by DRC's test development staff using the Partnership for Assessment of Readiness for College and Careers (PARCC) consortium's item bank as well as items from the Louisiana Department of Education's own item bank. Items taken from these banks were on pre-established item response theory (IRT) scales for ELA and mathematics and were reviewed and approved for use by LDOE content experts and committees of Louisiana educators. Braille forms and Spanish translations of mathematics forms were also developed. See Chapter 3, "Test Content Development," for additional details about the processes used to develop these test forms.

The following sections discuss two types of test-level scores that are reported to indicate a student's achievement on the LEAP 2025 assessments: the scale score and its associated level of achievement.

### 2.3 Scale Scores

A scale score indicates a student's total performance on the LEAP 2025 assessments. The overall scale score quantifies the achievement being measured by the assessments. In other words, the scale score represents the student's level of achievement, where higher scale scores indicate higher levels of achievement on the test and lower scale scores indicate lower levels of achievement. For all LEAP 2025 test forms, the lowest obtainable scale score (LOSS) is 650 and the highest obtainable scale score (HOSS) is 850 .

Scale scores are derived from raw scores (i.e., the number of items answered correctly). Raw scores depend on the items in a particular form of a test and can only be interpreted in terms of that particular set of test questions. This does not allow year-to-year or form-to-form comparison. Scale scores are more meaningful than raw scores because they maintain their meaning year-to-year, thus allowing comparisons of different test forms across the entire range of the ability scale.

### 2.4 Levels of Achievement

A student's performance on the LEAP 2025 assessments is reported in one of five levels of achievement: Advanced, Mastery, Basic, Approaching Basic, or Unsatisfactory. The cut scores for the ELA and mathematics achievement levels were established by PARCC using the Evidence-Based Standard Setting (EBSS) method (Beimers, Way, McClarty, \& Miles, 2012) for the PARCC Performance-Level Setting (PLS) process. Details regarding the PLS process can be found in the Performance Level Setting Technical Report (Pearson, 2015).

Descriptions of each level of achievement, in terms of what a student should know and be able to do, are provided with the LEAP 2025 Interpretive Guide (see Chapter 7).

### 2.5 Use of Test-Level Scores

The LEAP 2025 scale scores and achievement levels provide summary evidence of student performance relative to the Louisiana Student Standards. Classroom teachers may use these scores as evidence of student achievement in English I, English II, Algebra I, and Geometry. At the aggregate level, school system and school administrators may use this information for activities such as curriculum planning. The results presented in this technical report provide evidence that the scale scores and achievement levels are valid and reliable indicators of what students know, understand, and are able to do relative to the Louisiana Student Standards in ELA and mathematics.

### 2.6 Category- and Subcategory-Level Subscores

A student's performance on the ELA reporting categories (i.e., reading and writing) is reported by one of three ratings: Strong, Moderate, or Weak.

Additionally, subcategory subscores are reported at the student level for ELA and mathematics. ELA has three subcategories for reading and two subcategories for writing, as described in Table 3.1, ELA Reporting Categories and Subcategories. Mathematics has four subcategories, as described in Table 3.6, Overview of LEAP 2025 Mathematics Task Types and Reporting Categories. Subcategory performance is reported in one of three ratings: Strong, Moderate, or Weak.

Although the performance ratings are determined only by the items included within a category or subcategory, the level of knowledge and ability needed to demonstrate a performance rating is connected to the level of knowledge and ability required by the assessments: a Strong rating requires similar knowledge and ability as the Mastery or Advanced achievement levels, a Moderate rating requires similar knowledge and ability as the Basic achievement level, and a Weak rating requires similar knowledge and ability as the Unsatisfactory and Approaching Basic achievement levels.

#### Abstract

2.7 Use of the Category- and Subcategory-Level Ratings

The purpose of reporting category- or subcategory-level subscores on LEAP 2025 assessments is to show, for each student, the relationship between the overall achievement being measured and the skills in each of the areas defined by the reporting categories and subcategories. Teachers may use these ratings for individual students as indicators of strengths and weaknesses, but they are best corroborated by other evidence, such as grades, teacher feedback, and scores on other tests. Chapter 3 of this technical report provides evidence of content validity that supports the use of the category- or subcategory-level subscores. Chapter 9 of this technical report provides evidence of construct-related validity that further supports the use of these subscores.

## Chapter 3: Test Content Development

Content-related validity in achievement tests is evidenced by a correspondence between test content and the range of knowledge and skills that compose the construct the assessment is designed to measure (i.e., the ELA or mathematics Louisiana Student Standards). Content-related validity can be demonstrated through consistent adherence to test blueprints, through a high-quality test development process that includes review of items for accessibility to English Learners and students with disabilities, and through alignment studies performed by independent groups. This chapter provides a detailed discussion of the test development process. In particular, it shows how rigorous procedures were followed to construct tests that reflect the full range of content that the 2018-2019 LEAP 2025 high school assessments were expected to cover.

This chapter is particularly relevant to the following sections of the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014): Standards 4.0, 4.1, and 4.7. It also addresses Standards 3.1, 3.2, 3.9, and 4.12, which are discussed in pertinent sections of this chapter.

Standard 4.0 states the following:
Tests and testing programs should be designed and developed in a way that supports the validity of interpretations of the test scores for their intended uses. Test developers and publishers should document steps taken during the design and development process to provide evidence of fairness, reliability, and validity for intended uses for individuals in the intended examinee population. (85)

Standard 4.1 states the following:
Test specifications should describe the purpose(s) of the test, the definition of the construct or domain measured, the intended examinee population, and interpretations for intended uses. The specifications should include a rationale supporting the interpretations and uses of test results for the intended purpose(s). (85)

The 2018-2019 LEAP 2025 high school test specifications consisted of a blueprint and a design for each of the following tests: English I, English II, Algebra I, and Geometry. The 2018-2019 blueprints and test designs were closely aligned to the PARCC flagship blueprints that were used for the PARCC 2018-2019 test administrations. The test blueprints for the 2018-2019 LEAP 2025 high school ELA assessments were designed with the goal of having all students read, understand, and express their understanding of complex, grade-level texts. The test blueprints for the 2018-2019 LEAP 2025 mathematics assessments were designed with the goal of supporting students to become mathematically proficient by focusing on three components of rigor: conceptual understanding, procedural skill and fluency, and application. The 2018-2019 LEAP 2025 high school ELA and mathematics assessments provided questions that were reviewed by Louisiana educators to ensure their alignment to the Louisiana Student Standards and appropriateness for Louisiana students; measured the full range of student performance, including the performance of high- and lowperforming students; and informed educators and parents about student readiness in ELA and mathematics and whether students are "on track" for college and careers. For ELA and mathematics, the 2018-2019 LEAP 2025 assessments use the same blueprints and reporting categories and subcategories that were used in 2017-2018.

To construct the assessments following the LDOE-approved test blueprints and test designs, LDOE and DRC collaborated to use items from the PARCC- and Louisiana-owned item banks. Both item banks are comprised of items aligned to the Louisiana Student Standards. DRC contracted with PARCC and was provided access to the entire bank of items and passage sets that could potentially be used on operational forms. The acquired items and passages and the Louisiana-owned items and passage sets made up the available item pool used for the 2018-2019 LEAP 2025 high school forms construction. Please refer to the PARCC Model Content Frameworks for ELA/Literacy (Grades 3-11) and the PARCC Model Content Frameworks for Mathematics (Grades 3-11) for additional information about the development of item specifications and blueprints for the PARCC assessments. These resources can be accessed via the New Meridian website. LDOE and DRC confirmed that all items selected for use on the LEAP 2025 forms were appropriate for use on Louisiana assessments by convening committees of Louisiana educators who reviewed and approved items from the item banks prior to form selection.

The ELA and mathematics LEAP 2025 assessments for high school were developed based on the requirements of "RFP \#678PUR-LEAP 2025 English Language Arts and Mathematics Assessment System" as follows:

The assessments shall be

- aligned to the ELA and mathematics Louisiana Student Standards;
- designed to be accessible for use by the widest possible range of students, including, but not limited to, students with disabilities and students with limited English proficiency;
- constructed to yield valid and reliable test results;
- constructed to report student performance using achievement level policy definitions and reporting categories that are comparable to a significant number of other states;
- developed to limit the amount of testing time required and to be in compliance with all state laws regarding testing time;
- developed and reviewed with Louisiana educator involvement;
- non-computer adaptive;
- used in assessing students' readiness to successfully transition to postsecondary education and the workplace; and
- administered, scored, and reported through a separate administration contract.

The products of the above requirements are computer-based tests (CBTs) made of PARCC and Louisianaowned items aligned to the Louisiana Student Standards. Louisiana had access to the complete PARCC item bank when selecting items to build the forms needed for the 2018-2019 LEAP 2025 high school ELA and mathematics assessments. Items and passage sets were deemed appropriate for use on Louisiana assessments by Louisiana educators during an item alignment review. These items and passage sets were approved because they aligned to the Louisiana Student Standards and/or Louisiana Evidence Statements for mathematics and because they were free of issues related to bias, fairness, and sensitivity. These items and passage sets became the available item pool used to construct the 2018-2019 forms. For each course, three test forms were selected from the available pool of items and/or passage sets. DRC and LDOE content experts scrutinized each final blueprint to ensure optimal content coverage and prudent use of time and resources. In general, the blueprints represent content sampling proportions that reflect intended emphasis in instruction and mastery in each course and are comparable to the PARCC 2018-2019 flagship test blueprints. The test specifications provide the numbers of items by reporting category, assessment focus, and item type, and they demonstrate the desired proportions within test delivery and available item pool constraints. These specifications can be found in the 2018-2019 LEAP 2025 High School English Language Arts and Mathematics

Assessment Frameworks. All assessments were fixed forms, which means that all students who received the same form were administered the same set of items, as the forms were not adaptive.

The LEAP 2025 high school assessments are administered in fall, spring, and summer each school year. For fall and summer administrations, two forms are administered: an operational form and an administrative error form, which is used only if there is an administrative testing error (see Chapter 4 for additional details regarding the administrative error form). For spring administrations, two operational forms and one administrative error form are administered. In addition, spring administrations also include a senior-only form to allow students who will be graduating to receive their assessment results earlier than students who take the operational forms. The forms are administered on a rotating schedule, so they are not the same from administration to administration.

### 3.1 Defining the Specific Test Blueprint

The test blueprints for the 2018-2019 assessments were designed based on two primary factors: (1) the content requirements of the Louisiana Student Standards and (2) the reporting needs of the assessments.

## English I and English II Test Blueprints and Test Designs

The English I and English II tests were administered during operational testing windows: November 28 to December 14, 2018; April 15 to May 17, 2019; and June 17 to 21, 2019. Only two of the three types of performance tasks—Research Simulation Task, Literary Analysis Task, and Narrative Writing Task—were included on each of the Louisiana tests. All three types were represented across administrations (fall, spring, and summer), which encourages educators to focus on all three writing types. Since the choice of Literary Analysis Task or Narrative Writing Task is determined during the forms construction process, alternative blueprints—one with a Literary Analysis Task and a Research Simulation Task and the other with a Research Simulation Task and a Narrative Writing Task—are created for each course.

Student performance on the LEAP 2025 high school ELA assessments is reported by category and subcategory as outlined in the following table.

Table 3.1 ELA Categories and Subcategories

| Category | Subcategory | Subcategory Description |
| :---: | :--- | :--- |

These reporting categories provide parents and educators with valuable information about

- overall student performance, including readiness to continue further studies in English language arts;
- student performance broken down by subcategory, which may help identify when students need additional support or more challenging work in reading and writing; and
- how well schools and school systems help students achieve expectations.

The session testing times shown in the ELA test designs (see Tables 3.2 and 3.3) are based on PARCC testing times proportioned to be comparable based on the passage type being tested. The passage set that comes after the Narrative Writing Task or the Literary Analysis Task is designed to balance the reading load between the Narrative Writing Task or the Literary Analysis Task and the Research Simulation Task and to provide consistent timing in sessions 1 and 2.

Table 3.2 English I and English II Test Design—Literary Analysis Task and Research Simulation Task

| Session | Task/ Item Set | Number of Passages | Categories/ Subcategories | Number of Two-Point SR Items | Number of Points from Two-Point SR Items | Number of PCR Items | Number of Points from PCR Items | Total Number of Items | Total Number of Points | Assessable ELA Student Standards (by subcategory) | $\begin{aligned} & \text { Testing } \\ & \text { Time } \\ & \text { (minutes) } \end{aligned}$ |

*Reading vocabulary items must constitute at least eight points on the test.
**The time in session 3 allows for additional passage set that is a field-test or placeholder passage set.

The LEAP 2025 high school ELA assessments consist of tasks and reading passage sets. The tasks are described below.

- Narrative Writing Task
- This task asks students to read a literary text, answer a set of selected-response questions about the text, and create a narrative related to the text (e.g., finish the story or retell the story in another narrative form, such as a journal entry).
- This task focuses on students' ability to use narrative elements (e.g., dialogue, description) when writing.
- Literary Analysis Task
- This task provides students with an opportunity to show their understanding of literature. It asks students to read two literary texts, answer a set of selected-response questions about the texts, and write an extended response that compares and/or explains key ideas or elements in the texts (e.g., central idea/message, contribution of illustrations, characterization).
- This task focuses on students' ability to read complex text closely and asks them to carefully consider literature worthy of close study.
- Research Simulation Task
- This task mirrors the research process by presenting three texts on a given topic. Students answer a set of selected-response questions about the texts and then write an extended response about some aspect of the related texts (e.g., relationship between a series of events, ideas, or concepts; comparison/contrast of key details; presentation of information).
- This task requires students to synthesize information from related informational resources.

The following item types were included in the 2018-2019 LEAP 2025 high school ELA assessments:

- Selected-Response Items:
- Evidence-based selected response (EBSR): This item type consists of two parts. One part asks students to show their understanding of a text, and the other part asks students to identify evidence to support that understanding. The evidence supports a generalization, conclusion, or inference. This type of item is designed to provide students with opportunities to make explicit the evidence that supports their close analysis of a specific text.
- Multiple select (MS): This item type requires students to select more than one correct answer and may appear as a one-part question or as part of an EBSR item. This type of item allows for the assessment of students' ability to identify multiple pieces of evidence to support a claim.
- Technology enhanced (TE): This item type allows measurement of learning that may not be sufficiently measured by traditional multiple-choice items. TE items can measure the ordering of ideas within a summary; ordering of steps in a process; sorting, classifying, and categorizing ideas; matching of two themes/ideas to their unique evidence, etc. The technology used in TE items offers students additional ways to show understanding that parallels the classroom instructional techniques that teachers use to determine whether
students are able to comprehend complex, grade-level text. TE Items may involve any of the following:
- Highlighting text: requires students to select text-based answer(s) from within a larger text
- Drag and drop: requires students to move draggable elements (e.g., words, phrases, or sentences) into one or more drop boxes (e.g., cells within a table or part[s] of a diagram)
- Drop-down menu: requires students to select from one or more drop-down menus to complete a phrase or sentence
- Match interaction table: requires students to select a checkbox in each row from two or more columns to classify statements presented in each row
- Prose constructed response (PCR): This item type appears at the end of each task and asks students to create an extended, complete written response. It elicits evidence that students have understood a text or texts they have read and can communicate that understanding well, both in terms of written expression and in terms of knowledge of language and conventions.

A variety of item types allows for the measurement of the full range of student performance, including the performance of high- and low-performing students. Items and tasks should be clearly aligned to specific standards. Some items and tasks may ask students to draw evidence from one specific standard, while others may ask students to draw evidence from several standards.

The following tables detail the number of items and points by session and item type for English I and English II forms.

Table 3.4 Distribution of English I Items and Points by Session and Item Type

| Form | Administration | Session | EBSR |  | MS |  | TE |  | PCR |  | Total <br> No. of Pts. |

## Mathematics Test Blueprints and Test Designs

The mathematics assessments were administered during operational testing windows: November 28 to December 14, 2018; April 15 to May 17, 2019; and June 17 to 21, 2019. The 2018-2019 mathematics assessments included three test sessions, and each test session included the four mathematics subcategories and the three mathematics task types. See Table 3.6 for details about categories and task types.

Each item on the LEAP 2025 mathematics assessment is referred to as a task and is identified by one of three types: Type I, Type II, and Type III. As shown in the following table, each task type is aligned to one or two of four reporting categories: Major Content, Additional \& Supporting Content, Expressing Mathematical Reasoning, or Modeling \& Application. Each task type is designed to align to at least one of the Standards for Mathematical Practice (MP).

Table 3.6 Overview of LEAP 2025 Mathematics Task Types and Reporting Categories

| Task <br> Type | Description | Reporting Categories | Mathematical Practice(s) |
| :--- | :--- | :--- | :--- |
| Type I | Conceptual <br> understanding, fluency, <br> and application | Major Content: solve problems <br> involving the major content for the <br> grade level. <br> Additional \& Supporting Content: solve <br> problems involving the additional and <br> supporting content for the grade level. | Can involve any or all practices |
| Type II | Written arguments/ <br> justifications, critique of <br> reasoning, or precision in <br> mathematical <br> statements | Expressing Mathematical Reasoning: <br> express mathematical <br> ceasoning by <br> constructing mathematical arguments <br> and critiques. | Primarily MP.3 and MP. 6 but <br> may also involve any of the <br> other practices |
| Type III | Modeling/application in <br> a real-world context or <br> scenario | Modeling \& Application: solve real- <br> world problems engaging particularly in <br> the modeling practice. | Primarily MP.4 but may also <br> involve any of the other <br> practices |

These reporting categories provide parents and educators with valuable information about

- overall student performance, including readiness to continue further studies in mathematics;
- student performance broken down by mathematics subcategories, which may help identify when students need additional support or more challenging work; and
- how well schools and school systems help students achieve higher expectations.

Tables 3.7 and 3.8 provide the distribution of operational points by reporting category and by form for each mathematics course.

Table 3.7 Distribution of Points by Reporting Category—Algebra

|  | Form |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Reporting Category | AR | BR | D | E |
| Major Content | 28 | 28 | 28 | 28 |
|  <br> Supporting Content | $13^{*}$ | 14 | 14 | 14 |
| Expressing <br> Mathematical <br> Reasoning | 11 | 11 | 11 | 11 |
|  <br> Application | 15 | 15 | 15 | 15 |
| Total | $\mathbf{6 7}$ | $\mathbf{6 8}$ | $\mathbf{6 8}$ | $\mathbf{6 8}$ |

* A one-point item within the Additional \& Supporting Content reporting category was dropped from scoring in Form AR.

Table 3.8 Distribution of Points by Reporting Category—Geometry

|  | Form |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Reporting Category | AR | BR | D | E |
| Major Content | 26 | 26 | 26 | 26 |
|  <br> Supporting Content | 16 | 16 | 16 | 16 |
| Expressing <br> Mathematical <br> Reasoning | 11 | 11 | 11 | 11 |
|  <br> Application | 15 | 15 | 15 | 15 |
| Total | 68 | 68 | 68 | $\mathbf{6 8}$ |

The Major Content category for mathematics is broken into subcategories by course as follows:
Table 3.9 Major Content Subcategories by Course

| Course |  | Major Content Subcategories |
| :---: | :--- | :--- |
|  | $\bullet$ | Interpreting Functions |
| Algebra | $\bullet$ | Solving Algebraically |
|  | $\bullet$ | Solving Graphically/Rate of Change |

| Course | Major Content Subcategories |
| :---: | :--- |
| Geometry | $\bullet$ Congruence Transformations/Similarity |
|  | $\bullet$ Similarity in Trigonometry/Modeling \& Applying |

The resulting 2018-2019 LEAP 2025 mathematics test blueprints are shown in Tables 3.10 and 3.11.

Unlike the ELA test blueprints, which were organized by test sessions one through three, the mathematics test blueprints were organized by reporting categories, so it was necessary to define the general structure of the test forms by test session. The design goal was to have balanced test sessions with a variety of task types and equivalent testing times. For session 1a of the mathematics assessments, students were prohibited from using calculators, except those students with a calculator accommodation. Calculators were allowed to be used by all students in sessions 1b, 2, and 3. The general test structures (see Tables 3.12 and 3.13 ) guided test form sequencing and design. The LEAP 2025 Calculator Policy provided the basis for calculator designation of tasks and items.

[^1]The following item types were used in the 2018-2019 LEAP 2025 mathematics assessments:

- Multiple-choice: This item type requires students to select one correct answer from four answer choices. It may appear as a one-part question, as part of a two-part question, or as part of a constructed-response item. The multiple-choice items are worth one point.
- Multiple select: This item type requires students to select more than one correct answer from more than four answer choices. It may appear as a one-part question, as part of a two-part question, or as part of a constructed-response item. The multiple select items are worth one point. Students must choose all correct answers and no incorrect answers to receive credit.
- Short answer: This item type requires students to enter a numeric response by typing from the keyboard. It may appear as a one-part question, as part of a two-part question, or as part of a constructed-response item. The short answer items are worth one point. Unless specified in the question, students will earn credit for an answer that is equivalent to the correct numerical answer. Proper rounding may be required. Answers to short answer items can be positive or negative and must be entered in integer or decimal form.
- Keypad input items: This item type requires students to enter a mathematical response using a customized pallet of numbers, operations, variables, and/or mathematical symbols; allows the use of all rational and irrational numbers, expressions, and equations; and scores all equivalent responses as correct unless noted otherwise. This item type may appear as a one-part question, as part of a two-part question, or as part of a constructed-response item.
- Constructed-response items: This item type requires students to respond to an open-ended question, which must be typed into a response box; students may use the equation builder tool (specific to the course) to insert mathematical characters. This item type can be a single- or multipart item. Constructed-response items ask students to write explanations or justifications, model a process, and/or solve real-world, multistep contextual problems. Students may receive partial or full credit on constructed-response items, and maximum point values will vary by constructed-response task. Maximum values for constructed-response items are 3,4 , or 6 points.
- Technology enhanced items: This item type uses technology to capture student responses. Technology-enhanced items may appear as a one-part question, as part of a two-part question, or as part of a constructed-response item. The technology-enhanced items are worth one point. Technology-enhanced items may involve any of the following:
- Bar graph: requires students to complete a bar graph or histogram by raising/lowering each bar to a value
- Drag and drop: requires students to move draggable elements into one or more drop boxes
- Drop-down menu: requires students to select from one or more drop-down menus to complete a sentence, phrase, or expression/equation/inequality
- Hot spot: requires students to select one or more responses by choosing selectable areas on the screen
- Match interaction table: requires students to select a checkbox in each row from two or more columns
- Graph input: requires students to enter a response on a coordinate grid
- Number line input: requires students to enter a response on a number line
- Line plot: requires students to complete a line plot with " $X$ " as the input

A variety of item types allows for the measurement of the full range of student performance, including that of high- and low-performing students.

The following table details the number of items by point value and task type and the number of points per task type for each form.

Table 3.14 Distribution of Mathematics Tasks and Points by Task Type

| Form | Content Area | Type I |  |  |  | Type II |  |  | Type III |  |  | Total <br> Number of Points |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 pt. <br> Tasks | 2 pt. <br> Tasks | 4 pt. <br> Tasks | Points | 3 pt. <br> Tasks | 4 pt. <br> Tasks | Points | 3 pt. <br> Tasks | 6 pt. <br> Tasks | Points |  |
| AR | Algebra | 23* | 7 | 1 | 41 | 1 | 2 | 11 | 3 | 1 | 15 | 67* |
| BR | Algebra | 24 | 7 | 1 | 42 | 1 | 2 | 11 | 3 | 1 | 15 | 68 |
| D | Algebra | 24 | 7 | 1 | 42 | 1 | 2 | 11 | 3 | 1 | 15 | 68 |
| E | Algebra | 24 | 7 | 1 | 42 | 1 | 2 | 11 | 3 | 1 | 15 | 68 |
| AR | Geometry | 24 | 7 | 1 | 42 | 1 | 2 | 11 | 1 | 2 | 15 | 68 |
| BR | Geometry | 24 | 7 | 1 | 42 | 1 | 2 | 11 | 1 | 2 | 15 | 68 |

| E | Geometry | 24 | 7 | 1 | 42 | 1 | 2 | 11 | 3 | 1 | 15 | 68 |

* One Type I item worth 1 point was dropped from scoring in form AR.

## Item Development and Selection

The processes of item development and selection are discussed in this section in compliance with the Standards.

Standard 4.7 states the following:
The procedures used to develop, review, and try out items and to select items from the item pool should be documented. (87)

The items used in the 2018-2019 LEAP 2025 high school ELA and mathematics assessments came from the PARCC consortium's item bank and the Louisiana-owned item bank.

The items selected for use on the 2018-2019 LEAP high school forms were used to equate to the LEAP 2025 scale, which is comparable to the PARCC scale. Operational forms were selected based on LEAP 2025 high school test blueprint specifications, which were supported by statistical data from PARCC operational testing.

## Considerations of Test Fairness in Item Development

Standard 3.2 is particularly relevant to fairness in item development:
Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics. (64)

Bias and sensitivity guidelines used to develop the PARCC- and Louisiana-owned items help ensure the assessments are fair for all groups of test takers, despite differences in characteristics that include, but are not limited to, disability status, ethnic group, race, gender, regional background, native language, religion, sexual orientation, and socioeconomic status. DRC relied strongly on the bias and sensitivity guidelines in the development of the assessments, particularly in item selection and review. To be included in the assessments, items had to comply with the bias and sensitivity guidelines and be approved by Louisiana educators involved in the Louisiana alignment and item review meetings.

## PARCC Item Reviews

As part of PARCC's ongoing item development practices, several educator committees had already been convened to conduct rigorous reviews of every passage and item developed for the PARCC assessment system prior to the items becoming a part of the item bank that included items and passages available for selection on Louisiana forms. These reviews include

- text reviews of all passages (during which participants review and edit passages independently and then discuss content and bias concerns as a grade-level group),
- item reviews (during which committees review and edit items for adherence to PARCC foundational documents, basic principles of universal design, PARCC accessibility guidelines, selected metadata fields, and the PARCC style guide),
- bias and sensitivity reviews (during which educators and community members review items and tasks to confirm the absence of issues relating to bias, fairness, and sensitivity to ensure that items and tasks do not unfairly advantage or disadvantage any student subgroup over another subgroup),
- editorial reviews (during which the review committee completes a copy edit review and records member comments), and
- data reviews (during which educators evaluate item-level statistics to determine eligibility of items and tasks to move forward to the operational assessments).

Additional information on PARCC's item review processes and procedures can be found at the New Meridian Resource Center. Only items that have been approved by expert reviewers during text reviews (ELA only), item reviews, bias and sensitivity reviews, and editorial reviews are moved forward for field-testing by PARCC affiliate states. Of the field-tested items, only those determined to have acceptable statistics, either by having acceptable item parameters according to the data-review flagging criteria or by being approved by expert reviewers during data review, are eligible for review by Louisiana educators for potential use on an operational assessment. These processes follow the criteria set forth by the Standards.

Standard 3.1 states the following:
Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population. (63)

Standard 3.2 states the following:
Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics. (64)

Independent studies of PARCC passages and items have found that the content being licensed assesses the skills that matter most and is rigorous, aligned to standards, and accessible to students with disabilities and English Learners. For more information on the studies performed, refer to New Meridian's website: https://resources.newmeridiancorp.org/research/.

### 3.2 Louisiana Item Development and Item Review

## ELA Development Process

Item development for ELA began with a detailed analysis of the acquired item bank to determine the needs of the pool. This analysis resulted in development targets for each course beginning with the selection of passages. Development targets indicated whether passage sets should be short, long, or paired. They also determined whether passages should be literary or informational. Additional traits for each target, such as text complexity, standards that should be assessed, genre coverage, gender representation, topic variety, and ways to add diversity to the pool of passages available, were also provided. Once the targets were identified and approved by LDOE ELA content experts, DRC's ELA test development team worked to provide options for each target for LDOE review. Experienced passage finders recommended authentic texts, including permissioned and/or public domain passages. These initial selections were reviewed by DRC's ELA test development team members, who then analyzed the text complexity of each passage. The passages, any associated graphics, and the results of text complexity analyses were provided to LDOE. LDOE's ELA team reviewed the options and provided feedback to ensure that two options for each target were ready for review by Louisiana educators.

## Text Complexity Specifications for Field Test Passages

As part of the passage development process, a passage's text complexity is analyzed so that an appropriate grade-level placement for each passage can be made. The analysis of the passage's text complexity was captured on a placemat. (Please see Appendix A for a sample placemat.) DRC used a process that includes (1) a quantitative evaluation of the text and (2) a qualitative evaluation of the text. Passages and their respective placemats are submitted to LDOE during initial passage reviews. In addition, a third component, matching reader to text and task, is also taken into consideration during passage evaluation.

## Passage Review

In June 2018, in conjunction with the alignment reviews of items from the acquired item bank, passage reviews were conducted by Louisiana educator committees. During the review process, the committees, which represented a variety of perspectives, reviewed the proposed literary and informational passages to ensure the texts used to develop passage sets on the LEAP 2025 ELA tests were fair and appropriate for all students and would allow an opportunity for students to demonstrate their knowledge and skills in ELA. Educators reviewed the passages and provided feedback and a consensus decision about the status of each passage. The status identified whether the passage was acceptable to move forward with development or not acceptable to move forward with development. Educators also provided individual rankings of the preference for passages of each target type. Upon conclusion of the passage reviews, members of the LDOE and DRC's ELA test development teams met to discuss the results. Decisions regarding which passages would move forward to item development were made at that time.

Table 3.15 provides the count of passages brought to passage review and the status of those passages after passage review.

Table 3.15. LEAP 2025 June 2018 Passage Review

| Course | Number of <br> Passages <br> Reviewed | Accepted | Rejected |
| :---: | :---: | :---: | :---: |
| English I | 7 | 7 | 0 |
| English II | $8^{*}$ | 7 | 1 |

*Of the 8 passages, 4 were paired sets; 1 passage in a pair was rejected.

## ELA Item Writing and Review

Once passage sets were approved for development by Louisiana educators and content experts from the LDOE, the passage sets were provided to experienced item writers for development. Item writers participated in item writing training with Pearson, DRC's subcontractor, prior to developing items. The training involved discussion of the following:

- Passage set quality
- Passage sets have value.
- Passages sets are cohesive.
- Items are text dependent.
- Items are aligned to and reflect the rigor of the Louisiana Student Standards.
- Item type descriptions and examples of each
- Evidence-Based Selected Response
- Multiple Select
- Technology Enhanced
- Resources to support item writing
- PARCC practice tests
- PARCC released items
- Training on universal design and bias, fairness, and sensitivity
- Training on security and confidentiality

Once the items were written, they were revised as necessary by Pearson prior to delivery to the LDOE. The LDOE reviewed each batch of items and provided feedback that was implemented prior to the passage sets being prepared in mock test forms for review by committees of Louisiana educators at item content and bias review meetings.

At the item content and bias review meetings, course-level committees of ELA educators met to provide feedback on the alignment and appropriateness of items for use on Louisiana assessments. Louisiana educators reviewed items for alignment to content standards; grade appropriateness; issues of bias, fairness, and sensitivity; difficulty and cognitive complexity; and clarity of language. The discussion about difficulty and cognitive complexity included not only approving the cognitive complexity levels assigned to each item but also ensuring that the difficulty and cognitive complexity were appropriate for the course. Louisiana educators reviewed the items to ensure they represented a range of difficulty and cognitive complexity. Louisiana educators edited items as needed to ensure they were appropriate for use on Louisiana assessments, which allowed the items to move forward for possible field-testing. Any items deemed inappropriate were rejected if educators were not able to revise or recommend appropriate revisions for those items. Items that successfully passed through the item content and bias reviews were then embedded within operational test forms for field-testing, and data was collected on each field test item. For a detailed description of the process followed during the content and bias review meetings, see Appendix B.

## Mathematics Item Development

To determine the mathematics item development needs for field-testing in the Spring 2019 administration, the LDOE determined the count of items needed per course and then DRC content experts analyzed the item pool to determine the number of type II or type III items and the evidence statements/standards based on that analysis. DRC content experts reviewed standards coverage on the previous year's test by looking at the number and types of items used to cover each content standard, the difficulty range, the level of cognitive complexity covered by each content standard, and the topic/material presented in items (to ensure a variety of engaging topics are included). DRC determined gaps or holes in coverage, based on these criteria, to create an item development plan for the number and types of items to be newly developed for possible field-testing in spring 2019. DRC presented the item development plan to LDOE content experts, who then provided feedback to DRC. DRC and the LDOE collaborated to finalize the item development plan. DRC used Pearson as a subcontractor to have items written. Item writers participated in item writing training with Pearson and LDOE prior to developing items. The training included

- an overview of the assessable content and task types,
- a description of the type II and type III items,
- an explanation of how to use the standards and evidence statements when writing items,
- examples of type II and type III items,
- a discussion that covered item writing guidelines,
- examples of items with issues,
- training on security and confidentiality, and
- training on universal design and issues of bias, fairness, and sensitivity

These items were reviewed by LDOE and revised by Pearson. Once items were approved by LDOE, they became part of the set of items that were taken to item content and bias reviews with Louisiana educators in summer 2018. Refer to Appendix C, "Item Development Plans", for counts of the items developed for content and bias reviews and field-testing.

At the mathematics item content and bias reviews, committees met to provide feedback on the alignment and appropriateness of items. Louisiana educators reviewed items for alignment to content standards; grade appropriateness; issues of bias, fairness, and sensitivity; and difficulty and cognitive complexity, which included determining whether the difficulty and cognitive complexity were appropriate for each item and whether the items available represented a range of difficulty and cognitive complexity. For a detailed description of the process followed during the item content and bias reviews, see Appendix B. Louisiana educators edited items as needed to ensure they were appropriate for use on Louisiana assessments, which allowed the items to move forward for possible field-testing. Any items deemed inappropriate were rejected if educators were not able to revise those items. Items that successfully passed through the content and bias reviews were then placed on a test form in a field test position, and data was collected on each field test item. Once field-testing was complete, the items were taken to range-finding, where committees of Louisiana educators reviewed Louisiana student responses to assign true scores to responses that would be used in training materials for the scoring of items. The field-tested constructed response items were then scored, and the data were analyzed by DRC psychometricians.

### 3.3 Guidelines on Bias, Fairness, and Sensitivity

ELA and mathematics item writers and content and bias committee members were provided with guidelines on bias, fairness, and sensitivity issues as they pertain to testing. The information included definitions of bias and sensitivity, examples of different types of bias, and topics of concern, which were specific to given content areas. Writers were also provided with sample items that contained bias, fairness, and sensitivity issues and examples of how to revise items and graphics to ensure universal design is applied. The writers were also given information on accessibility and accommodations, including information on how to address language, visual elements, and design issues when considering students in special populations (e.g., students with disabilities and English Learners).

## Types of Bias:

- Stereotyping
- may result when an image is formed by relating certain characteristics to ALL members of a group and may include physical characteristics, intellectual characteristics, emotions, careers, activities, and domestic or social roles
- Gender Bias
- may result when members of either sex are unnecessarily presented in stereotypical activities, occupations, and/or situations or are unnecessarily presented as having stereotypical emotions or characteristics
- Regionalism
- may result from the inclusion of terms that are not commonly used nationwide or within a particular region of the state in which the test will be given
- Ethnic or Cultural Bias
- may result from the inclusion of terms, concepts, or situations that are demeaning and/or offensive to a particular ethnic group or culture
- Socioeconomic or Class Bias
- may result from the inclusion of activities, possessions, or ideas that may not be common to all students
- Religious Bias
- may result from the inclusion of terms, concepts, or situations that are demeaning and/or offensive to a particular religious group
- Ageism
- may result from the inclusion of terms, concepts, or situations that are demeaning and/or offensive to elders or to older persons (defined as people older than the reference group) and may also involve issues of bias with other age groups, including teenagers and young children, or even with the age of the reference group itself, where the grade (age) of a student is depicted negatively
- Bias against Persons with Disabilities
- may result from the inclusion of terms, concepts, or situations that are demeaning and/or offensive to persons with disabilities

## Louisiana Item Alignment Review

Independent of PARCC reviews, DRC conducts the Louisiana item alignment reviews, during which Louisiana educators review items and passage sets for alignment to the Louisiana Student Standards and for appropriateness of the items and tasks for students in Louisiana, including being free of issues of bias, fairness, and sensitivity.

DRC, with guidance from LDOE, conducted the Louisiana item alignment reviews in June 2017 with committees of Louisiana educators. Course-specific committees met for two days for mathematics and three days for ELA to provide feedback on the alignment and appropriateness of items that made up the PARCC item bank. To the extent possible, each committee included educators from different parts of Louisiana to represent all Louisiana students (e.g., special education students, English Learners, students with disabilities). Committee members were also representative of the diverse demographics of the state.

As described in the preceding sections, items presented at these reviews went through a rigorous review process before and after the items were field-tested by PARCC to ensure quality and appropriateness. Items were selected for inclusion in the form selection pool, imported into IDEAS (DRC's item banking system), and formatted for use on Louisiana test forms. They were placed on mock test forms to allow them to be reviewed as students would see them. Louisiana educators reviewed these items to confirm they were acceptable for use on a Louisiana assessment. Educators reviewed items individually to verify that each item aligned to the Louisiana Student Standard(s) for that item prior to discussing the items as a group. In addition, educators reviewed item keys and discussed the difficulty and cognitive complexity of each item and task. The groups came to a consensus regarding the status of each item: Accepted with Current Alignment, Accepted with Realignment, or Rejected. Items that were accepted were determined to appropriately measure the intended standard(s) and be free of issues of bias, fairness, or sensitivity that could impact student responses to the item. For a detailed description of the process followed during the item alignment reviews, including results and descriptions of the demographics of each committee, see Appendix D, "Item Alignment Review Process."

### 3.3 Operational Test Selection

Operational item selection for the 2018-2019 administration took place from June through September 2018 by LDOE and DRC. The PARCC and Louisiana item pools were used to select fixed LEAP 2025 ELA and mathematics high school forms.

The LEAP 2025 high school assessments were given as computer-based tests (CBTs). For students unable to participate in a CBT administration, accommodated print forms were available for secure download and
printing by authorized users. Test administrators transcribed all student responses into the appropriate CBT test form. (See Chapter 4 for additional details.)

## Item and Passage Selection Process and Criteria

The item and passage selection process used for forms construction was a content-focused, collaborative process between the LDOE and DRC ELA and mathematics content specialists, and it was followed by a psychometric evaluation of each selection. The critical psychometric consideration, other than individual item performance, was the degree to which the selected items reflected the 2018-2019 LEAP 2025 targets, which were supposed to match the Spring 2018 LEAP 2025 operational forms. Although the item pool was limited, items that were determined to be very difficult (i.e., IRT difficulty parameter $b>2.0$ ) and/or not discriminating (i.e., IRT discrimination parameter $a<0.3$ ) were avoided when possible.

## Item Selection Guidelines

- Using the acquired pool of items, content-area assessment specialists select ELA passage sets and tasks that consist of quality texts displaying diversity in topics and authors and mathematics tasks that match the blueprint. The sets and tasks include items that cover a range of Louisiana Student Standards and/or Evidence Statements (mathematics only) and address the appropriate reporting categories.
- Content-area assessment specialists and research analysts verify that each item meets psychometric guidelines for excellence as available item-performance data allows.
- Forms include adequate content coverage, as required by the detailed test blueprint.
- Each form contains an anchor set that includes passage sets or tasks from a previous administration. The anchor set, which is a mini-blueprint of the form, ensures comparability between the 2018 form and the 2019 form. The remaining sets or tasks selected for a form complete the blueprint requirements.
- No item in a form should "clue" (or provide the answer to) another item on that same form.
- Clang association should be avoided. Clang is when a distractor can be associated with a stem word by sound rather than meaning (e.g., rhyming, alliteration).
- Passage sets in ELA forms should be diverse.
- Forms should be diverse, including a variety of text types, including texts that appeal to a diverse student population.
- Forms should include a wide range of topics and a variety of questions.
- Correct answer distributions should follow best practice (no more than 3 keys of the same answer option in a row).
- Forms must not contain any items that have been released to the public.

## Review of the ELA Items and Forms

DRC and LDOE ELA content specialists and members of educator committees verified that the items were in compliance with the guidelines provided by LDOE, including alignment to the content standards and appropriateness for Louisiana students. Because establishing content validity is one of the most important aspects in the legal defensibility of a test, the alignment of the items to the content standards must be reviewed and verified at every stage of the test development process. As a result, it is essential that an item selected for a form link directly to the content standard that it purports to measure. The ELA content specialists also verified all items against their designated content codes and metadata, both to evaluate the correctness of the coding and to ensure that the given item measures what it purports to measure.

In addition, the ELA content specialists reviewed each item for item quality, ensuring that the items were in compliance with industry guidelines for clarity, style, accuracy, and appropriateness for Louisiana students. While there are many published guidelines for reviewing assessment items, the following list serves to summarize the major considerations content specialists followed when reviewing items to ensure the items conformed to item quality standards for good, reliable, and fair test questions.

## Guidelines for Reviewing Items Selected for Forms

## A good item should

- have the appropriate number of correct answer(s) based on the item type;
- have only one clear, correct answer for each part of an evidence-based selected response (ESR) item that has only four answer options in each part;
- have only the indicated number of correct answers for a multiple select (MS) item or item part;
- have a correctly assigned content code (i.e., item map);
- measure one main idea or standard, unless the item is a complex item, such as a prose constructed-response (PCR) item;
- measure the objective or content standard it is designed to measure;
- be at the appropriate level of rigor;
- be simple, direct, and free of ambiguity;
- make use of vocabulary and sentence structure that is appropriate for the grade level assessed;
- be based on content that is accurate and current;
- when appropriate, contain stimulus material that is clear and concise and provides all the information needed;
- contain graphics that are clearly labeled, when appropriate;
- contain answer choices that are reasonably parallel in length and structure;
- contain answer choices that are plausible and reasonable in terms of the requirements of the question and the students' grade-level expectations;
- contain distractors that relate to the question in the same way and can be supported by a rationale;
- reflect current teaching and learning practices for the content area; and
- be free of gender, ethnic, racial, cultural, socioeconomic, regional, and other forms of bias.

## Review of the Mathematics Items and Forms

DRC and LDOE mathematics content specialists also ensured the items were in compliance with the guidelines provided by LDOE, including alignment to the content standards and appropriateness for Louisiana students. Since establishing content validity is one of the most important aspects in the legal defensibility of a test, the alignment of the items to the content standards must be reviewed and verified at every stage of the test development process. As a result, it is essential that an item selected for a form link directly to the content standard that it purports to measure. The mathematics content specialists also verified all items against their designated content codes and metadata, both to evaluate the accuracy of the coding and to ensure that the given item measures what it purports to measure.

In addition, the mathematics content specialists reviewed each item for item quality, ensuring that the test items are in compliance with industry guidelines for clarity, style, accuracy, and appropriateness for Louisiana students. While there were many published guidelines for reviewing assessment items, the list below serves to summarize the major considerations mathematics content specialists followed when reviewing items to ensure they conformed to item quality standards for good, reliable, and fair test questions.

## Guidelines for Reviewing Items Selected for Forms

A good item should

- contain answer choices that are reasonably parallel in length and structure;
- have the appropriate number of correct answer(s) based on item type:
- only one clear, correct answer for a multiple-choice (MC) item
- only the indicated number of correct answers for a multiple select (MS) item;
- have a correctly assigned content code (i.e., item map);
- measure one content standard or evidence statement;
- measure the content standard or evidence statement it is designed to measure;
- be at the appropriate level of rigor;
- be simple, direct, and free of ambiguity;
- make use of vocabulary and sentence structure that is appropriate for the grade level assessed;
- be based on content that is accurate and current;
- when appropriate, contain stimulus material that is clear and concise and provides all the necessary information;
- when appropriate, contain graphics that are clearly labeled;
- contain answer choices that are plausible and reasonable in terms of the requirements of the question and the student's level of knowledge;
- contain distractors that relate to the question in the same way and can be supported by a rationale;
- reflect current teaching and learning practices in the content area; and
- be free of gender, ethnic, racial, cultural, socioeconomic, regional, and other forms of bias.

## Item-Selection Options for Special Cases

While every effort is made to select a test form that meets all psychometric guidelines for excellence, it may not be possible to comply with all the psychometric criteria for item/form difficulty due to item pool limitations. In these cases, critical psychometric guidelines are followed while allowing some tolerance on less critical item-selection guidelines. The tolerance of meeting target characteristics, the relative exposure of previously used operational items, and other considerations (e.g., content coverage) may possibly be affected in such cases.

## Psychometric Review

The psychometric evaluation of each selection was centered on reviewing the PARCC items with operational item parameters.

## Selecting Targets

The spring 2018 LEAP 2025 operational form was selected to be the target form in 2018-2019 LEAP 2025 form construction. The rationale for the choice of the targets was that each 2017-2018 LEAP 2025 form should be on the PARCC scale and be closely comparable to PARCC assessments. Figure 3.1 and Figure 3.2 for English I and II and Figure 3.3 and Figure 3.4 for Algebra I and Geometry show the test characteristic curves (TCCs) and standard errors of measurement (SEMs) of the final forms compared to those of the target forms. The left line graph displays the TCC of the target form and the selected 2018-2019 forms, summarizing the expected proportion of the maximum raw score needed to achieve the raw score. The right line graph displays the SEM of the scale score of the target form and the selected 2018-2019 forms. This summarizes the amount of measurement error surrounding a scale score.

Figure 3.1 Spring English I Form-Building Evaluation for 2018-2019 Administrations

Notes:

- The target form is the Spring 2018 LEAP 2025 HS test form.
- Forms D and E are Spring 2019 LEAP 2025 HS test forms.

Figure 3.2 Spring English II Form-Building Evaluation for 2018-2019 Administrations

Notes:

- The target form is the Spring 2018 LEAP 2025 HS test form.
- Forms D and E are Spring 2019 LEAP 2025 HS test forms.

Figure 3.3 Algebra I Form-Building Evaluation for 2018-2019 Administrations

Notes:

- The target form is the Spring 2018 LEAP 2025 HS test form.
- Forms D and E are Spring 2019 LEAP 2025 HS test forms.

Figure 3.4 Geometry Form-Building Evaluation for 2018-2019 Administrations

Notes:

- The target form is the Spring 2018 LEAP 2025 HS test form.
- Forms D and E are Spring 2019 LEAP 2025 HS test forms.

## Selecting Anchors

Anchor sets used in the common item nonequivalent group design underwent considerable scrutiny due to the generally accepted guideline that the anchor set should mirror the total (or reference) test in terms of content and item characteristics. One of the critical psychometric considerations for an anchor set is the extent to which the TCC and SEM of the anchor set aligns to that of the total test.

### 3.4 Universal Design

Course-level assessments that follow universal design guidelines allow participation of the widest possible range of students, resulting in more valid inferences about students' performances. Such assessments may reduce the need for accommodations by reducing or eliminating access barriers associated with the tests themselves. Table 3.16 presents the elements of universal design (Thompson \& Thurlow, 2002). The elements of universal design are relevant to both item development and form construction. This section describes how the elements of universal design were addressed in the construction of the 2018-2019 test forms in compliance with AERA, APA, \& NCME (2014) Standard 3.1, which states the following:

Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population. (63)

Universal design requires that assessments measure the performance of students with a wide range of abilities and skills, ensuring that students with diverse learning needs receive opportunities to demonstrate competence on the same content. To ensure that students can access the tests, the LEAP 2025 assessments include simple, clear, and intuitive instructions and procedures; maximum readability and comprehensibility; and maximum legibility. The online test specifications define how directions and test items are formatted
online, including the spacing between an item stem and answer choices and other page elements (such as online tools and Help files) to ensure consistent, clean visual appearance. Test directions at the beginning of each test session are clearly and simply stated, and the wording of such instructions is standardized as much as possible across tests to ensure clarity and consistency while being comparable to PARCC.

Table 3.16 Elements of Universal Design

| Element | Explanation |
| :--- | :--- |
| Inclusive Assessment <br> Population | Tests designed for state, school system, or school accountability must <br> include every student except those in the alternate assessment, and this is <br> reflected in assessment design and field testing procedures. |
| Precisely Defined Constructs | The specific constructs tested must be clearly defined so that all construct- <br> irrelevant cognitive, sensory, emotional, and physical barriers can be <br> removed. |
| Accessible, Non-Biased Items | Accessibility is built into items from the beginning, and bias review <br> procedures ensure that quality is retained in all items. |
| Amenable to | The test design facilitates the use of needed accommodations (e.g., all <br> items can be in braille form). |
| Accommodations | All instructions and procedures are simple, clear, and presented in |
| understandable language. |  |

### 3.5 Accommodations and Designated Supports

AERA, APA, \& NCME (2014) Standard 3.9 states the following:

Test developers and/or test users are responsible for developing and providing test accommodations, when appropriate and feasible, to remove construct-irrelevant barriers that otherwise would interfere with examinees' ability to demonstrate their standing on the target constructs. (67)

Students with disabilities, students with 504 plans, and English Learners (ELs) may be provided test administration accommodations based on their accommodation plan. More information on accommodations can be found in Chapter 4. Accommodation coding instructions can be found in the Test Coordinators Manual.

Accommodated print forms were developed for the high school ELA and mathematics tests for those students who were unable to participate in an online administration. For a detailed description of the process used to develop the accommodated print forms and how to modify technology-enhanced items for use in an accommodated print form, see Appendix C, "Accommodated Print Form Creation."

Braille forms were constructed for each course to enable students with visual impairments to participate in the LEAP 2025 assessments. Braille forms were based on the accommodated print forms. There are no largeprint versions of the accommodated print forms. Instead, students needing a large-print version use largersized monitors and/or the magnification features of the online testing system. All online test content has been developed to scale in relation to the available area on larger monitors while maintaining the correct aspect ratio. Specific recommendations on how to transcribe items into braille were provided by the braille publisher to produce the braille version of the LEAP 2025 high school assessments and the test administrator's notes that accompany the braille forms. The goal was to maximize the number of items on the braille forms that could be transcribed into braille.

The following assessment features were available to all students and do not require any documentation either prior to or during the assessment:

- blank scratch paper and graph paper
- calculators (to be used in the calculator section only)
- color overlay
- contrasting colors/reverse colors
- directions in native language
- equation builder
- bookmark
- general administration directions clarified
- general administration directions read aloud and repeated as necessary
- general masking
- headphones
- highlighters
- line guides
- magnifiers/variable zoom
- measurement tools
- redirection of student to the test
- specialized furniture or equipment
- sticky note/notepad
- strikethrough
- and writing/formatting tools (for ELA constructed-response items only).

Accessibility features were available for all students with the particular need documented in their Individualized Education Programs (IEPs), Individual Accommodation Plans (IAPs), English Learner (EL) plans, or Personal Needs Profiles (PNPs). The following accessibility features were available: individual testing, small group testing, student reads assessment aloud to himself or herself, adaptive and specialized equipment or furniture, and math read aloud (text-to-speech or human reader).

Accommodations were available for students who have an IEP, IAP, or EL plan. The following accommodations were available: braille test materials, calculation device and math tools for non-calculator sections of mathematics assessments, transferred answers, recorded answers, mathematics Spanish read aloud, translated mathematics test, and test read aloud (text-to-speech). For details on these accessibility features and accommodations, see the LEAP 2025 Accommodations and Accessibility Features User Guide.

For a detailed description of the process used to develop the Spanish translation forms of the mathematics tests, see Appendix E, "Forms Development Process for Spanish Translations Forms."

### 3.6 Item and Task Specifications

AERA, APA, \& NCME (2014) Standard 4.12 states the following:
Test developers should document the extent to which the content domain of a test represents the domain defined in the test specifications. (89)

The item and task specifications are designed to ensure that the assessment items measure the assessment's claims. The purpose of the item and task specifications is to define the characteristics of the items and tasks that will provide the evidence to support one or more claims. To do this, the item and task specifications delineate the types of evidence, or targets, that should be elicited for each reporting category within a grade level. The specifications provide explicit guidance on how to write items to elicit the desired evidence. To address 2018-2019 LEAP 2025 high school assessment comparability goals with PARCC, PARCC claims, subclaims, and evidence statements, along with guidance provided by the Louisiana Student Standards for ELA and Mathematics, were used as item and task specifications.

The item and task specifications provide guidance on how to measure the targets (i.e., standards) first found in the content specifications and guidelines on how to create the items that are specific to each assessment target and reporting category. In ELA and mathematics, item specifications describe the knowledge, skills, and processes being measured by each item type aligned to particular standards.

These item specifications were developed for each course and standard to delineate the expectations of knowledge and skill to be included on test questions. In addition, the ELA and mathematics item and stimulus specifications provide guidance on determining the appropriateness of task and stimulus materials (i.e., the materials that a student must refer to when working on a test question). The stimulus specifications also provide information on the characteristics of stimuli or activities that should be avoided because they are not important to the knowledge, skill, or process being measured. This underscores DRC's efforts to select items that are accessible to the widest range of students possible; in other words, 2018-2019 LEAP 2025 items were selected according to the elements of universal design.

### 3.7 Summary

In summary, the overall purpose of this chapter is to explicate the procedures used in the development of the 2018-2019 LEAP 2025 high school assessments. The efforts by LDOE and DRC in developing the LEAP 2025 high school assessments are in alignment with multiple best practices of the test industry but, in particular, support the following AERA, APA, \& NCME (2014) standards:

Standard 3.1 Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population. (63)

Standard 3.2 Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics. (64)

Standard 3.9 Test developers and/or test users are responsible for developing and providing test accommodations, when appropriate and feasible, to remove construct-irrelevant barriers that
otherwise would interfere with examinees' ability to demonstrate their standing on the target constructs. (67)

Standard 4.0 Tests and testing programs should be designed and developed in a way that supports the validity of interpretations of the test scores for their intended uses. Test developers and publishers should document steps taken during the design and development process to provide evidence of fairness, reliability, and validity for intended uses for individuals in the intended examinee population. (85)

Standard 4.1 Test specifications should describe the purpose(s) of the test, the definition of the construct or domain measured, the intended examinee population, and interpretations for intended uses. The specifications should include a rationale supporting the interpretations and uses of test results for the intended purpose(s). (85)

Standard 4.7 The procedures used to develop, review, and try out items and to select items from the item pool should be documented. (87)

Standard 4.12 Test developers should document the extent to which the content domain of a test represents the domain defined in the test specifications. (89)

## Chapter 4: Test Administration

Chapter 4 of the technical report describes the processes implemented and the information disseminated to help ensure standardized test administration procedures and, thus, uniform test administration conditions for students. According to the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014), "The usefulness and interpretability of test scores require that a test be administered and scored according to the test developer's instructions" (111). This chapter examines how test administration procedures implemented for the 2018-2019 Louisiana Education Assessment Program (LEAP 2025) strengthen and support the intended score interpretations and reduce construct-irrelevant variance that could threaten the validity of score interpretations.

Chapter 4 demonstrates how the LEAP 2025 assessments adhere to AERA, APA, \& NCME (2014) Standards $4.15,6.1,6.2,6.3,6.4,6.6$, and 6.7. Each standard will be explicated in the relevant section of this chapter.

To ensure that the LEAP 2025 assessments are administered in accordance with the department's mandates, the LDOE takes a primary role in communicating with and training school system personnel. The development of the assessments is a collaborative effort between LDOE and DRC. The LDOE conveys to school systems the purpose of the assessments and the importance of test administration being consistent with test industry standards. The tests and administration standards must also meet the State Board of Elementary and Secondary Education policies and the mandates of both state and federal legislation.

To accomplish these goals, the LDOE provides train-the-trainer opportunities for school system test coordinators, who, in turn, administer test-administration training to schools within their school systems. The LDOE conducts quality assurance visits during testing to ensure that school systems adhere to the standardized administration of the tests.

The school system test coordinators are responsible for the schools within their school systems. They disseminate information to each school, assist with test administration, and serve as liaisons between the LDOE and the schools in their system. The LDOE also provides assistance with and interpretation of assessment data and test results.

Ancillary materials for the LEAP 2025 test administration contribute to the body of evidence of the validity of score interpretation. This section examines how the test materials address the standards related to test administration procedures.

For the administration of the LEAP 2025 High School assessments, DRC produced the following test administration manuals (TAMs): High School Test Administration Manual: LEAP 2025 and EOC, Fall 2018; High School Test Administration Manual, Spring 2019; High School Test Administration Manual, Summer 2019. DRC also produced the following district test coordinators manuals (TCMs): Test Coordinators Manual: LEAP 2025 and EOC, Fall 2018; Test Coordinators Manual: LEAP 2025 and EOC, Spring 2019; Test Coordinators Manual: LEAP 2025 and EOC, Summer 2019. LDOE assessment administration and development staff review these manuals, provide feedback, and give final approval. Each TCM includes information about LEAP 2025 HS and EOC ELA, mathematics, U.S. history, and biology. It provides detailed instructions for school system and school test coordinators on distributing and collecting test materials and for returning them to DRC as outlined in its table of contents.

## Test Coordinators Manual Table of Contents

1. Key Dates
2. Resources Available in eDIRECT
3. LEAP 2025 and EOC High School Alerts
4. Pre-Administration Oath of Security and Confidentiality Statement
5. Post-Administration Oath of Security and Confidentiality Statement
6. General Information
6.1. eDIRECT and INSIGHT
7. LEAP 2025/EOC High School
7.1. Testing Requirements
8. Test Security
8.1. Key Definitions
8.2. Violations of Test Security
8.3. Testing Guidelines
8.4. Testing Conditions
8.5. Testing Schedule
8.6. Extended Time for Testing
8.7. Extended Breaks
8.8. Makeup Testing
8.9. LEAP 2025 High School and End-of-Course Testing Times
9. Roles and Responsibilities
9.1. District Test Coordinator
9.2. School Test Coordinator
9.3. Chief Technology Officer
10. Managing Test Tickets
10.1. Student Transfers
10.2. Locked Test Tickets
10.3. Technical Issues
10.4. Invalidating Test Tickets
11. Resources for Online Testing
11.1. High School Test Administration Manual
11.2. eDIRECT User Guide
11.3. LEAP 2025 Accommodations and Accessibility User Guide
11.4. INSIGHT Technology User Guide
11.5. Student Tutorials
11.6. Online Tools Training (OTT)
12. Post-administration Rescoring Process for LEAP 2025/EOC Tests
13. Request for Rescoring
14. Void Notification

The TAMs provide detailed instructions for administering the LEAP 2025 assessments. The manuals include instructions for test security, test preparation, administration of tests, and post-test procedures. Information included in the TAMs is listed below.

Test Administrators Manual Table of Contents

17. Post-Test Procedures
17.1. Test Administrator Post-Administration Oath of Security and Confidentiality Statement
17.2. Returning Test Materials to the School Test Coordinator
18. Index

The Standards contain multiple references that are relevant to test administration. Information in the TAMs addresses these standards.

The directions for test administration found in the manual address Standard 4.15, which states:

The directions for test administration should be presented with sufficient clarity so that it is possible for others to replicate the administration conditions under which the data on reliability, validity, and (where appropriate) norms were obtained. Allowable variations in administration procedures should be clearly described. The process for reviewing requests for additional testing variations should also be documented. (90)

The LEAP 2025 Test Administration Manuals provide instructions for activities conducted before, during, and after testing with sufficient detail and clarity to support reliable test administrations by qualified test administrators. To ensure uniform administration conditions throughout the state, instructions in the manuals describe the following: general rules of online testing; assessment duration, timing, and sequencing information; and the materials required for testing.

Furthermore, the standardized procedures addressed in the test administration manual need to be followed. The Standards state in Standard 6.1:
"Test administrators should follow carefully the standardized procedures for administration and scoring specified by the test developer and any instructions from the test user" (114).

It was essential that the LEAP 2025 was administered according to the prescribed test administration manual to ensure the usefulness and interpretability of the test scores and to minimize sources of constructirrelevant variance. It should be noted that adhering to the test schedule is also a critical component. The test administration manuals include instructions for scheduling the test within the state testing window. The test administration manuals also contain the schedule for timing each test session. The test timing schedule is presented in Table 4.1.

Standard 6.3 Changes or disruptions to standardized test administration procedures or scoring should be documented and reported to the test user. (115)

The LDOE staff administer reports on testing concerns that describe a wide range of improper activities that may occur during testing, including the following: copying and reviewing test questions with students; cueing students during testing, verbally or with written materials on the classroom walls; cueing students nonverbally, such as by tapping or nodding the head; allowing students to use a calculator on parts of the test where it is not allowed; allowing students to correct or complete answers after tests have been submitted; splitting sessions into two parts; ignoring the standardized directions in the online assessment; reading the ELA assessment to students (with the exception of those students with the read-aloud accommodation); paraphrasing parts of the test to students; changing or completing (or allowing other school personnel to change or complete) student answers; allowing accommodations that are not written in the Individualized

Education Program (IEP); allowing accommodations for students who do not have an IEP; or defining terms on the test.

Each administration includes an administrative error retest, which provides an opportunity for students to retake a test that was voided during the regular test window because of improper activities that occurred during testing (e.g., the student was not given enough time to complete the test, the student was not provided proper accommodations during the testing time, the teacher or administrator provided information or answers that resulted in the test being voided).

Standard 6.4 The testing environment should furnish reasonable comfort with minimal distractions to avoid construct-irrelevant variance. (116)

The test administration manuals outline the steps that teachers should take to prepare classroom environments for administering the LEAP 2025 assessments. These steps include the following:

- Determine the layout of the classroom environment.
- Plan seating arrangements. Allow enough space between students to prevent the sharing of answers.
- Eliminate distractions such as bells or telephones.
- Use a Do Not Disturb sign on the door of the testing room.
- Make sure classroom maps, charts, and any other materials that relate to the content and processes of the test are covered, removed, or out of students' view.

Standard 6.6 Reasonable efforts should be made to ensure the integrity of test scores by eliminating opportunities for test takers to attain scores by fraudulent or deceptive means. (116)

The test administration manuals present instructions for post-test activities to ensure that online tests are submitted and that printed test materials are handled properly to maintain the integrity of student information and test scores. Detailed instructions guide test examiners in submitting all online test records. For students who were administered a braille test form, examiners are instructed to transcribe students' responses from the braille test form into the online testing system (INSIGHT) exactly as the responses appear in the original form.

Standard 6.7 Test users have the responsibility of protecting the security of test materials at all times. (117)

Throughout the manuals, test coordinators and examiners are reminded of test security requirements and procedures to maintain test security. Specific actions that are direct violations of test security are so noted. Detailed information about test security procedures is presented under "Test Security" in the test administration manuals.

### 4.1 Return Material Forms and Guidelines

The test coordinators manual instructs test coordinators on how to organize, pack, and return testing materials to DRC for secure inventory purposes. The LDOE assessment administration and development staff have opportunities to review these materials, provide feedback, and give final approval. The purpose of the instructions is to ensure that the secure test materials are properly accounted for and organized appropriately for return shipment.

### 4.2 Security Checklists

As soon as printed test materials are received by a school system, the district test coordinator ensures the first and last security barcodes on the tests match the packing list he or she received. The district test coordinator then packages the test materials to be sent to schools. District test coordinators are required to return communication assistance scripts (CAS) and braille test materials to DRC. School systems are required to document nonstandard situations, including lost, damaged, destroyed, extra, or missing materials. Any material not accounted for is placed on a missing materials list, which is used by DRC and LDOE to follow up with all districts to ensure security of all materials.

### 4.3 Interpretive Guides

An understanding of what test scores mean and how to interpret score reports is essential to making valid interpretations of the test scores. The LEAP 2025 HS Interpretive Guide is written for Louisiana teachers and administrators who receive the LEAP 2025 score reports. More details about the guide can be found in Chapter 7.

### 4.4 Test Security Measures

Maintaining the security of all test materials is crucial to preventing the possibility of random or systematic errors, such as unauthorized exposure of test items, that would affect the valid interpretation of test scores. Several test security measures are implemented for the LEAP 2025 assessments. Test security procedures are discussed throughout the Test Coordinators Manuals and Test Administration Manuals.

Test coordinators and administrators are instructed to keep all test materials in locked storage, except during actual test administration, and access to secure materials must be restricted to authorized individuals only (e.g., test administrators and the school test coordinator). During testing sessions, the test administrators are directly responsible for the security of the LEAP 2025 assessments, must account for all test materials, and supervise the test administration at all times.

## Data Forensic Analyses

Due to the importance of the LEAP 2025 assessments, it is prudent to ensure that the results from the assessments are based on effective instruction and true student achievement. While there are many ways to achieve meaningful understanding of student knowledge via test scores, there are also ways to obtain higher test scores that are not related to actual learning. To assist in ensuring that assessment results are valid, data forensic analyses are conducted to help separate meaningful gains from spurious gains. It is important to note that although the results may be used to identify potential problems within a school, the identification of a problem is not an accusation of misconduct.

Multiple methods of analysis were incorporated into the forensic analysis. The following methods were applied:

- Response-Change Analysis
- Score Change Analysis
- Web Monitoring
- Plagiarism Detection

## Response-Change Analysis

Students make changes to answer choices when taking the LEAP 2025, and this is expected behavior. Unfortunately, changing student answers is also an opportunity for school personnel to improve classroom performance. The response-change analysis focuses on identifying school- and test-administrator level
response-change patterns that are statistically improbable when compared to the expected pattern at the state level.

## Score-Change Analysis

It is anticipated that performance on the LEAP 2025 will improve over time from legitimate sources such as changes in the curriculum and improvement in instruction. However, large and unexpected score changes may be a sign of testing impropriety. The LDOE applied an approach wherein the state's change in performance from one year to the next is compared to a schools' and test administrators' change in performance during the same time frame. Schools and test administrators were identified when the level of change was statistically unexpected.

## Web Monitoring

LEAP 2025 operational test content should not appear outside the boundaries of the forms administered. To protect Louisiana test content, the internet is monitored for postings which contain, or appear to contain, potentially exposed and/or copied LDOE test content. When test content is verified, steps are taken so that the infringing content is removed quickly.

## Plagiarism Detection

The LDOE monitors for two different plagiarism situations: copying from student to student and copying from an outside source, such as Wikipedia or other internet sources. Instances of plagiarism are identified regardless of whether an item is scored by human scorers or artificial intelligence. Alerts are set to identify responses that may indicate teacher interference, plagiarism, or disturbing content (e.g., possible physical or emotional abuse, suicidal ideation, threats of harm to the student in question or others, etc.). Alerted responses are given additional review so the appropriate response can be taken.

### 4.5 Test Administration

The 2018-2019 assessments were administered to students within the state testing windows of November 28 to December 14, 2018; April 15 to May 17, 2019; and June 17-21, 2019. Each session of the LEAP 2025 assessments was required to be administered in one block of time.

## Time

All sessions of the LEAP 2025 high school ELA and mathematics assessments were timed. Only students with an extended time accommodation were permitted to exceed the established time limits of any given session. The timing schedule of the LEAP 2025 assessments is presented in Table 4.1.

## Table 4.1 LEAP 2025 Administration Schedule Timing by Session

| Course | Session | Minutes |
| :---: | :---: | :---: |
| English I | 2 | 90 |
|  | 1 | 90 |
|  | 2 | 80 |
|  | 3 | 90 |
| Algebra I | 3 | 90 |
|  | 1 a | 80 |
|  | 3 | 25 |
|  | 1 a | 55 |
|  | 3 | 80 |
|  | 30 |  |

## Accommodations

Accommodations are allowed on the LEAP 2025 assessments.
Accommodations may be used by a student who qualifies under the Individual with Disabilities Act (IDEA), has an IEP or a Section 504 plan of the Americans with Disabilities Act, or identifies as an English Learner (EL). Accommodations must be specified in the qualifying student's individual plan and must be consistent with accommodations used during daily classroom instruction and testing. The use of any accommodation must be indicated on the student information sheet at the time of test administration. AERA, APA, \& NCME Standard 6.2 states:

When formal procedures have been established for requesting and receiving accommodations, test takers should be informed of these procedures in advance of testing. (115)

In compliance with this standard, the LEAP 2025 Test Administration Manuals contain the list of universal tools, designated supports, and accommodations permissible for the LEAP 2025 assessments. Further guidance can be found in the LEAP 2025 Accommodations and Accessibility Features User Guide.

Visually impaired students may be provided braille forms for any assessment.
Tables 4.2 through 4.4 summarize the numbers of reportable students receiving accommodations or designated features by type for the 2018-2019 LEAP 2025 HS administrations. Accommodation assignment guidance is provided in the LEAP 2025 Accommodations and Accessibility Features User Guide. The analyses
are based on census data and include only those students who received accommodations or designated features and received a scale score on the ELA or Mathematics LEAP 2025 high school assessments. The percentage represents the percentage of the census population receiving that accommodation or designated feature.

Table 4.2 Fall 2018 Number and Percentage of Students Receiving Accommodations by Accommodation/Designated Feature Type, as identified in eDIRECT

| Content | Accommodation/Designated Feature | Number | Percentage |

### 4.6 Summary

In summary, the overall purpose of each of the test administration trainings and the ancillary materials is to keep school systems informed about policies and procedures related to testing in general and the LEAP 2025 program in particular. The information imparted is clearly related to standardizing the administration of the LEAP 2025, maintaining the security of the assessment, allowing access to the assessments for special populations through appropriate accommodations, and maintaining the integrity of the scores. These communication and training efforts by LDOE and the ancillary information developed by DRC address multiple best practices of the testing industry but, in particular, are related to the following standards:

Standard 4.15 The directions for test administration should be presented with sufficient clarity so that it is possible for others to replicate the administration conditions under which the data on reliability, validity, and (where appropriate) norms were obtained. Allowable variations in administration procedures should be clearly described. The process for reviewing requests for additional testing variations should also be documented. (90)

Standard 6.1 Test administrators should follow carefully the standardized procedures for administration and scoring specified by the test developer and any instructions from the test user. (114)

Standard 6.3 Changes or disruptions to standardized test administration procedures or scoring should be documented and reported to the test user. (115)

Standard 6.4 The testing environment should furnish reasonable comfort with minimal distractions to avoid construct-irrelevant variance. (116)

Standard 6.6 Reasonable efforts should be made to ensure the integrity of test scores by eliminating opportunities for test takers to attain scores by fraudulent or deceptive means. (116)

Standard 6.7 Test users have the responsibility of protecting the security of test materials at all times. (117)

## Chapter 5: Scoring of Constructed-Response and TechnologyEnhanced Items

In this chapter, the scoring process used for the 2018-2019 LEAP 2025 high school ELA and mathematics assessments is described, with a particular focus on the handscoring of constructed-response items and the automated scoring of technology-enhanced items. At the end of this section, the results of the inter-rater reliability for the handscoring of the 2018-2019 LEAP 2025 constructed-response items are presented.

Chapter 5 demonstrates how the LEAP 2025 assessments adhere to the American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards $4.18,4.20,6.8$, and 6.9. Each standard is presented in the pertinent section of this chapter. Standard 4.18 provides some general guidance for Chapter 5:

Procedures for scoring and, if relevant, scoring criteria, should be presented by the test developer with sufficient detail and clarity to maximize the accuracy of scoring. Instructions for using rating scales or for deriving scores obtained by coding, scaling, or classifying constructed responses should be clear. This is especially critical for extended-response items such as performance tasks, portfolios, and essays. (91)

Chapter 5 explains the procedures used for scoring the LEAP 2025 ELA and Mathematics constructedresponse items and technology-enhanced items. The scoring criteria used for each item are not presented in this chapter to preserve the integrity of the items for future use.

### 5.1 Constructed-Response Item Scoring Process

Constructed-response items were scored by human raters who were trained by DRC. Handscoring and Artificial Intelligence (AI) processing rules are detailed in Appendix F. Seven different ELA items across English I and English II (noted in Table 5.1) were scored by an AI engine, Pearson's Intelligent Essay Assessor (IEA), using scoring models previously developed by Pearson. Second reads of $10 \%$ of these responses were completed by human scorers; handscoring supervisors also reviewed the responses that IEA was not able to score.

Table 5.1 Constructed-Response Operational Scoring

| Administration | Course | Handscoring Only | Al Scoring | Al Vendor |
| :---: | :---: | :---: | :---: | :---: |
| Fall 2018 | English I | N/A | 902152, 902161 | Pearson |
|  | English II | N/A | 902331, 906197 | Pearson |
|  | Algebra I | All CRs | N/A |  |
|  | Geometry | All CRs | N/A |  |
| Spring 2019 | English I | $\begin{aligned} & 902161,906152, \\ & 983215 \end{aligned}$ | 902152, 914552 | Pearson |
|  | English II | $\begin{aligned} & \text { 902331, 902354, } \\ & 983688 \end{aligned}$ | 906197, 983642 | Pearson |
|  | Algebra I | All CRs | N/A |  |
|  | Geometry | All CRs | N/A |  |
| Summer 2019 | English I | N/A | 902161, 906152 | Pearson |
|  | English II | N/A | 902331, 906197 | Pearson |
|  | Algebra I | All CRs | N/A |  |
|  | Geometry | All CRs | N/A |  |

## Selection of Scoring Evaluators

Standard 4.20 states the following:
The process for selecting, training, qualifying, and monitoring scorers should be specified by the test developer. The training materials, such as the scoring rubrics and examples of test takers' responses that illustrate the levels on the rubric score scale, and the procedures for training scorers should result in a degree of accuracy and agreement among scorers that allows the scores to be interpreted as originally intended by the test developer. Specifications should also describe processes for assessing scorer consistency and potential drift over time in raters' scoring. (92)

The following sections explain how scorers were selected and trained for the LEAP 2025 ELA and Mathematics handscoring process and how scorers were monitored throughout the handscoring process.

## The Recruitment and Interview Process

DRC strives to develop a highly qualified, experienced core of evaluators to appropriately maintain the integrity of all projects. All readers hired by DRC to score the 2018-2019 LEAP 2025 high school ELA and mathematics test responses had at least a four-year college degree.

DRC has a human resources director dedicated solely to recruiting and retaining the handscoring staff. Applications for reader positions are screened by the handscoring project manager, the human resources director, or recruiting staff to create a large pool of potential readers. In the screening process, preference is given to candidates with previous experience scoring large-scale assessments and with degrees emphasizing the appropriate content areas. At the personal interview, reader candidates are asked to demonstrate their proficiency in writing by responding to a DRC writing topic and their proficiency in mathematics by solving word problems with correct work shown. These steps result in a highly qualified and diverse workforce. DRC personnel files for readers and team leaders include evaluations for each project completed. DRC uses these evaluations to place individuals on projects that best fit their professional backgrounds, their college degrees, and their performances on similar projects at DRC. Once placed, all readers go through rigorous training and qualifying procedures specific to the project on which they are placed. Any scorer who does not complete this training and demonstrate the ability to apply the scoring criteria by qualifying at the end of the process is not allowed to score live student responses.

## Security

Each DRC scoring center is a secure facility. All employees are issued photo identification badges and are required to wear them in plain view at all times. Access to scoring centers is limited to badge-wearing staff and to visitors accompanied by authorized staff. All readers are made aware that no scoring materials may leave the scoring center, and all readers must sign legally binding confidentiality agreements before work begins. DRC retains these agreements for the duration of the contract. To prevent the unauthorized duplication of secure materials, cell phone and camera use within the scoring rooms is strictly forbidden. Readers only have access to the student responses they are qualified to score. Each scorer is assigned a unique username and password to access the DRC imaging system and must qualify before viewing any live student responses. DRC maintains full control of who may access the system, and which items each scorer may score. No demographic data is available to scorers at any time.

## Handscoring Training Process

Standard 6.9 specifies:
Those responsible for test scoring should establish and document quality control processes and criteria. Adequate training should be provided. The quality of scoring should be monitored and documented. Any systematic source of scoring errors should be documented and corrected. (118)

## Training Material Development

DRC scoring supervisors trained scorers using training materials from two sources.

1. PARCC-approved training materials provided by PARCC. These materials were developed according to processes described in PARCC technical reports and include the following:

- Passages, prompts, and associated stimuli
- Rubrics
- Anchor sets
- Practice sets
- Qualifying sets (for prototype items only)

2. Math training materials developed by DRC in conjunction with and approved by LDOE. These materials were made for use with DRC-developed math items (which were newly operational in the spring of 2019) according to processes described in DRC's response to the LDOE's "REQUEST FOR PROPOSALS For LEAP 2025 Assessment Administration (RFP \#: 815200-20150723001)".

- Prompts
- Rubrics
- Anchor sets
- Practice sets
- Qualifying sets (for all DRC-developed items)

## Training and Qualifying Procedures

Handscoring involves training and qualifying team leaders and evaluators, monitoring scoring accuracy and production, and ensuring security of both the test materials and the scoring facilities. LDOE visits the scoring centers to review training materials and oversee the training process. An explanation of the training and qualification procedures follows.

DRC used the PARCC-approved mathematics and ELA training and qualifying materials to score two categories of items: "prototype" items and "abbreviated" items. Note that, like the PARCC "prototype" items for math, full sets of training and qualifying materials were also developed for all DRC-developed math items. The training and qualifying procedures DRC used for these items was the same process outlined below for PARCC-approved "prototype" math items.

## Prototype Items

A small number of items (two each for Algebra I and Geometry and one for ELA) included in the Louisiana forms were prototype items, meaning they had full sets of associated training materials, including anchor sets, practice sets, and qualifying sets. DRC started the training process with a review of passages and items, rubrics, and anchor sets, followed by the scoring and discussion of practice sets and qualifying sets. Once this process was completed for a prototype item included on the Louisiana form, qualified readers started scoring live student responses for that item.

## Abbreviated Items

Abbreviated items required a two-step training and qualifying process. First, scorers trained and qualified as described above using PARCC-approved materials for an associated prototype item that was similar to the abbreviated one they would be scoring on the Louisiana form. ${ }^{1}$ Readers who did not qualify on the prototype item training were not allowed to continue the training.

After qualifying on the associated prototype item training, a reader received additional item-specific training on the abbreviated item he or she was going to score. This consisted of an item-specific anchor set and two item-specific practice sets. After completing the abbreviated item training, the reader could begin scoring live student responses for the abbreviated item.

[^2]The following tables detail the composition of the training materials provided by Pearson for mathematics and ELA.

Table 5.2 Mathematics Training Set Composition

| Set Type | Prototype Item <br> Training | Abbreviated Item Training | Annotated |
| :--- | :--- | :--- | :--- |
| Anchor Set | 3 responses per score point <br> (Composite items had 3 <br> responses per composite <br> score.) | 3 responses per score point <br> (Composite items had 3 <br> responses per composite <br> score.) | Yes |
| Practice Set 1 | 10 responses representing the <br> range of responses | 10 responses representing the <br> range of responses | Yes |
| Practice Set 2 | 10 responses representing the <br> range of responses | 10 responses representing the <br> range of responses | Yes |
| Qualifying Set 1 | 10 responses comparable to <br> the anchor set responses | 10 responses comparable to <br> the anchor set responses | No |
| Qualifying Set 2 | 10 responses comparable to <br> the anchor set responses | No |  |
| Qualifying Set 3 | No |  |  |
| For DRC-developed math items, examples of responses at the top score points may not have been <br> present in some anchor, training, and qualifying sets as there were few or no examples found during <br> rangefinding or subsequent field test scoring. In such cases, DRC Scoring Directors identified examples <br> of these scores during live scoring to supplement reader training. |  |  |  |

Table 5.3 ELA Training Set Composition

| Set Type | Prototype Item Training | Abbreviated Item Training | Annotated |
| :---: | :---: | :---: | :---: |
| Anchor Set* | 3 responses per score point | 16 responses per item: <br> - Anchor Sets for abbreviated RST and LAT item training included scores for the combined trait Reading Comprehension and Written Expression (RCWE). <br> - Anchor Sets for abbreviated NWT item training included scores for Written Expression (WE). | Yes |
| Practice Set 1 | 5 responses representing the range of responses for <br> - the Reading Comprehension and Written Expression (RCWE) trait (for LAT and RST items) <br> - the Written Expression trait (for NWT items) | 10 responses representing the range of responses for the trait appropriate to the task type | Yes |
| Practice Set 2 | 5 responses representing the range of responses for the Knowledge and Use of Language Conventions trait | 10 responses representing the range of responses for the conventions trait | Yes |
| Practice Set 3 | 10 responses representing the range of responses for both traits appropriate to the task type |  | Yes |
| Practice Set 4 | 10 responses representing the range of responses for both traits appropriate to the task type |  | Yes |
| Qualifying Set 1 | 10 responses comparable to the anchor set responses (included both traits appropriate to the task type) |  | No |
| Qualifying Set 2 | 10 responses comparable to the anchor set responses (included both traits appropriate to the task type) |  | No |
| Qualifying Set 3 | 10 responses comparable to the anchor set responses (included both traits appropriate to the task type) |  | No |
| Direct Copy <br> Set** | 3-5 responses composed entirely or partially of text copied from passage or passages (included both traits appropriate to the task type) | 3-5 responses composed entirely or partially of text copied from passage or passages (included both traits appropriate to the task type) | Yes |

[^3]Some items selected for use on the spring 2019 administration were previously only field-tested by PARCC. Consequently, the abbreviated training materials available for use with these items were abridged versions of typical abbreviated sets of materials. They consisted of:

- An Anchor Set (for ELA, some have annotations and some lack examples of the top scores)
- One Practice Set of 5 responses (scored but not annotated in the case of ELA)
- Approximately 10 validity responses

Since these materials were somewhat limited compared to typical abbreviated materials (the main difference being a lack of formal written annotations and fewer practice responses), DRC bolstered the training by using the PARCC-approved field test validity responses provided by New Meridian as additional practice responses. DRC Scoring Directors then pulled additional responses from operational Louisiana student responses to use as validity responses during the scoring window. The Scoring Directors also found examples of higher-scoring responses that might be missing from the field test anchors. The validity and additional exemplar responses, along with the DRC Scoring Directors' notes for all papers used during the training of the abbreviated, fieldtest only items, were submitted to LDOE for approval. It is important to note that readers still had to qualify via standard qualification procedures on the prototype items for all items by first going through full training with the appropriate prototype Anchor Set, Practice Sets 1-4, and Qualifying Sets 1-3 (as well as the Conventions sets).

## Qualifying Standards

DRC followed the same qualification standards that Pearson used for PARCC. Scorers demonstrated their ability to apply the scoring criteria by qualifying (i.e., scoring with acceptable agreement with true scores on qualifying sets). After each qualifying set was scored, the DRC scoring director responsible for training led the scorers in a discussion of the set. Any scorer who did not qualify by the end of the qualifying process for an item was not allowed to score live student responses.

Table 5.4 Mathematics Qualifying Standards

|  | Perfect Agreement | Perfect Plus Adjacent Agreement |
| :--- | :--- | :--- |
| $0,1,2$ Rubric | $80 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3$ Rubric | $70 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3,4$ Rubric | $70 \%$ on two of three sets | $95 \%$ on two of three sets |

Table 5.5 Mathematics Qualifying Standards (Composite Items)*

| Composite (multipart) <br> Items | Perfect Agreement | Perfect Plus Adjacent Agreement |
| :--- | :--- | :--- |
| 0,1 Rubric | $90 \%$ on two of three sets | $100 \%$ on two of three sets |
| $0,1,2$ Rubric | $80 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3$ Rubric | $70 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3,4$ Rubric | $70 \%$ on two of three sets | $95 \%$ on two of three sets |

*For mathematics composite items, the appropriate qualifying standard had to be achieved on each part of the item. For example, if an item had Part A with a top score of 1 , Part B with a top score of 2 , and Part $C$ with a top score of 3 , a scorer/supervisor would need to achieve $90 \%$ perfect agreement on Part $A, 80 \%$ perfect agreement on Part $B$, and $70 \%$ perfect agreement on Part C, with no more than one nonadjacent score per part across all three qualifying sets.

Table 5.6 ELA Qualifying Standards

| Perfect Agreement | Perfect Plus Adjacent Agreement |
| :--- | :--- |
| 70\% average for both traits on two of three <br> qualifying sets | $96 \%$ across the three qualifying sets combined <br> on both traits |
| 70\% on each trait at least once across three <br> qualifying sets |  |

ELA readers were required to meet all three of the qualifications listed in Table 5.6. Perfect plus adjacent agreement of $96 \%$ means that out of the entire pool of scores that a reader gave across the three qualifying sets for an item, no more than $4 \%$ of those scores could be nonadjacent. In other words, no more than 2 of the 60 applied scores could be nonadjacent ( 3 sets $\times 10$ responses/set $\times 2$ traits $=60$ applied scores).

## Monitoring the Scoring Process

Standard 6.8 states
Those responsible for test scoring should establish scoring protocols. Test scoring that involves human judgment should include rubrics, procedures, and criteria for scoring. When scoring of complex responses is done by computer, the accuracy of the algorithm and processes should be documented. (118)

The following section explains the monitoring procedures that DRC uses to ensure that handscoring evaluators follow established scoring criteria while items are being scored. Detailed scoring rubrics, which specify the criteria for scoring, are available for handscoring evaluators for all constructed-response items.

## Reader Monitoring Procedures

Throughout the handscoring process, DRC project managers, scoring directors, and team leaders reviewed the statistics that were generated on a daily basis. DRC used one team leader for every 10 to 12 readers, which was the same ratio that Pearson used for PARCC. If scoring concerns were apparent among individual scorers, team leaders dealt with those issues on an individual basis. If a scorer appeared to need clarification of the scoring rules, DRC supervisors typically monitored one out of five of the scorer's readings, making adjustments to that ratio as needed. If a supervisor disagreed with a reader's scores during monitoring, he or she provided retraining in the form of direct feedback to the reader, using rubric language and applicable training responses.

## Validity Sets and Inter-Rater Reliability

In addition to the feedback that supervisors provided to readers during regular read-behinds and the continuous monitoring of inter-rater reliability and score point distributions, DRC also conducted validity scoring using PARCC-approved validity responses supplied by PARCC and LDOE-approved validity responses identified by DRC scoring supervisors during live scoring for newly operational DRC-developed math items and PARCC field-test only items. Validity responses were inserted among the live student responses.

The validity responses were added to DRC's image handscoring system prior to the beginning of scoring. Validity reports compared readers' scores to pre-determined scores and were used to help detect potential room drift and individual scorer drift. This data was used to make decisions regarding the retraining and/or release of scorers, as well as the rescoring of responses.

Approximately $10 \%$ of all live student responses were scored by a second reader to establish inter-rater reliability statistics for all constructed-response items. This procedure is called a "double-blind read" because the second reader does not know the first reader's score. DRC monitored inter-rater reliability based on the
responses that were scored by two readers. If a scorer fell below the expected rate of agreement, the team leader or scoring director retrained the scorer. If a scorer failed to improve after retraining and feedback, DRC removed the scorer from the project. In this situation, DRC removed all scores assigned by the scorer in question. The responses were then reassigned and rescored.

To monitor inter-rater reliability, DRC produced scoring summary reports on a daily basis. DRC's scoring summary reports display exact, adjacent, and nonadjacent agreement rates for each reader. These rates are calculated based on responses that are scored by two readers, and their definitions are included below.

- Percentage Exact (\%EX) - total number of responses by reader where scores are the same, divided by the number of responses that were scored twice
- Percentage Adjacent (\%AD)-total number of responses by reader where scores are one point apart, divided by the number of responses that were scored twice
- Percentage Nonadjacent (\%NA) -total number of responses by reader where scores are more than one score point apart, divided by the number of responses that were scored twice

The following table provided by Pearson shows the expectations for validity and inter-rater reliability:
Table 5.7 Agreement Rate Requirements for Validity and Inter-Rater Reliability

| Subject | Score Point Range | Perfect Agreement | Perfect Agreement + <br> Adjacent |
| :---: | :--- | ---: | ---: |
|  | $0-1$ | $90 \%$ | $100 \%$ |
|  | $0-2$ | $80 \%$ | $95 \%$ |
|  | $0-3$ | $70 \%$ | $95 \%$ |
|  | $0-4$ | $65 \%$ | $95 \%$ |
| ELA | Multi-trait 0-3 or 0-4 <br> (varies by grade and <br> trait) | $65 \%$ | $96 \%$ |
|  | each trait) |  |  |

Each reader was required to maintain a level of exact agreement on validity responses and on inter-rater reliability as shown under "Perfect Agreement" in the table above. Additionally, readers were required to maintain an acceptably low rate of nonadjacent agreement. To monitor this, DRC summed each reader's exact and adjacent agreement rates and required each reader to maintain the levels shown under "Perfect Agreement + Adjacent" in the table above.

## Calibration Sets

PARCC provided DRC with PARCC-approved calibration responses for all operational items that came from the PARCC item pool. DRC pulled calibration responses for DRC-developed math items as well as additional responses for field-test only items from PARCC. DRC used these sets to perform calibration across the entire scorer population for an item if trends were detected (e.g., low agreement between certain score points if a certain type of response was missing from initial training). These calibrations were designed to help refocus scorers on how to properly use the scoring guidelines. They were selected to help illustrate particular points and familiarize scorers with the types of responses commonly seen during operational scoring. After readers scored a calibration set, the scoring director reviewed it from the front of the room, using rubric language and scoring concepts exemplified by the anchor responses to explain the reasoning behind each response's score.

## Reports and Reader Feedback

Reader performance and intervention information were recorded in reader feedback logs. These logs tracked information about actions taken with individual readers to ensure scoring consistency in regard to reliability, score point distribution, and validity performance. In addition to the reader feedback logs, DRC provided LDOE with handscoring quality control reports for review throughout the scoring window. Further detail about these reports can be found in Appendix F.

### 5.2 Inter-Rater Reliability

A minimum of $10 \%$ of the constructed responses in ELA and mathematics were scored independently by a second reader. This was the case regardless of whether the first reader was human or AI. The statistics for inter-rater reliability were calculated for all items at all grades. To determine the reliability of scoring, the percentage of perfect agreement and adjacent agreement between the first and second scores was examined.

A total of 79 operational items were scored by human readers across all LEAP 2025 high school ELA and mathematics assessments. The inter-rater reliability rates and the total numbers of reads are shown in Tables 5.8-5.10 for ELA items, Tables 5.11-5.13 for mathematics items, Tables 5.14-5.16 for Spanish mathematics items, and Table 5.17 for mathematics field test items.

As shown in Tables 5.8-5.10, raters demonstrated at least 99\% perfect and adjacent agreement for all ELA handscored items. As shown in Tables 5.11-5.13, raters demonstrated at least 99\% perfect and adjacent agreement for mathematics items. As shown in Tables 5.14-5.16, raters demonstrated 100\% perfect and adjacent agreement for Spanish mathematics items. As shown in Table 5.17, raters demonstrated 100\% perfect and adjacent agreement for mathematics field test items.

Table 5.8 Inter-Rater Agreement, English Language Arts Items, Fall 2018

*N/A if an item does not have multiple parts
** Second Reads may be less than 10\% of Total Reads or N/A for some items, because the smaller quantities of responses allowed scoring to be done directly by expert scorers/supervisors or via paired scoring between a supervisor and scorer. As a result, fewer were routed through the $10 \%$ read-behind process.

### 5.3 Technology-Enhanced Item Scoring Process

All technology-enhanced items, as well as EBSR, MPSR, and SA items, were processed through DRC's autoscoring engine and scored according to the assigned scoring rules established during content development by PARCC or DRC in conjunction with LDOE. DRC ensured that all rubrics and scoring rules were verified for accuracy before scoring any technology-enhanced items. DRC established an adjudication process for technology-enhanced items and short answer responses to verify that correct answers were identified. DRC's technology-enhanced scoring process included the following procedures:

- A scoring rubric was created for each technology-enhanced item. The rubric described the one and only correct answer for dichotomously scored items (i.e., items scored as either right or wrong). If partial credit was possible, the rubric described in detail the type of response that could receive credit for each score point.
- The information from the scoring rubric was entered into the scoring system within the item banking system so that the rubric resided in one place along with the item image and other metadata. This scoring information included details that varied by item type. For example, for a drag-and-drop item, the information included which object is to be placed in each drop region to receive credit.
- The information was then verified by another autoscoring expert.
- After testing started, reports were generated that showed every response, how many students gave that response, and the score the scoring system provided for that response.
- The scoring was then checked against the scoring rubric using two levels of verification.
- If any discrepancies were found, the scoring information was modified and verified again. The scoring process was then rerun. This checking and modification process continued until no other issues were found.
- As a final check, a report was generated that showed all student responses, their frequencies, and their received scores.

### 5.4 Multiple-Choice and Multiple-Select Item Scoring Process

Responses to multiple-choice and multiple-select items were captured during test administration. In the case of braille forms, student responses to these items were transcribed into the online system by a test administrator.

### 5.5 Summary

The information presented in this chapter summarizes the scoring procedures for different types of items and the steps taken by DRC to ensure accuracy in the autoscoring and handscoring processes. The inter-rater reliability statistics presented in Section 5.2 demonstrate that the items were scored reliably. These efforts by DRC address multiple best practices of the testing industry but are particularly related to AERA, APA, \& NCME (2014) Standards 4.18, 4.20, 6.8, and 6.9:

Standard 4.18 Procedures for scoring and, if relevant, scoring criteria, should be presented by the test developer with sufficient detail and clarity to maximize the accuracy of scoring. Instructions for using rating scales or for deriving scores obtained by coding, scaling, or classifying constructed responses should be clear. This is especially critical for extended-response items such as performance tasks, portfolios, and essays. (91)

Standard 4.20 The process for selecting, training, qualifying, and monitoring scorers should be specified by the test developer. The training materials, such as the scoring rubrics and examples of test takers' responses that illustrate the levels on the rubric score scale, and the procedures for training scorers should result in a degree of accuracy and agreement among scorers that allows the scores to be interpreted as originally intended by the test developer. Specifications should also describe processes for assessing scorer consistency and potential drift over time in raters' scoring. (92)

Standard 6.8 Those responsible for test scoring should establish scoring protocols. Test scoring that involves human judgment should include rubrics, procedures, and criteria for scoring. When scoring of complex responses is done by computer, the accuracy of the algorithm and processes should be documented. (118)

Standard 6.9 Those responsible for test scoring should establish and document quality control processes and criteria. Adequate training should be provided. The quality of scoring should be monitored and documented. Any systematic source of scoring errors should be documented and corrected. (118)

## Chapter 6: Operational Data Analyses

This chapter of the LEAP 2025 High School technical report describes the analyses that were conducted on the operational data. These include a classical item analysis and examination of the raw scores and an item response theory (IRT) analysis involving calibrating, scaling, and linking.

This section presents the classical item statistics, including aggregate raw score statistics and individual itemlevel statistics. Next, this section discusses the IRT models used for calibrating the data and addresses the purpose of data calibration and scaling for each content area. The calibration samples are then presented, followed by the data calibration results, including the model-data fit for the Louisiana student data. If the IRT models fit the empirical item response distributions for the population about which generalizations are to be made (i.e., Louisiana students), then the claim that the scores are valid indicators of anderlying ability is strengthened. The lowest obtainable scale score (LOSS) and highest obtainable scale score (HOSS) for the LEAP 2025 tests are also presented.

Chapter 6 demonstrates how LEAP 2025 assessments adhere to American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards $1.8,4.14,5.2,5.13,5.15$, and 7.2 . Each standard is explicated within the appropriate section of this chapter. Standard 7.2 provides general guidance that is relevant to this chapter. It states the following:

The population for whom a test is intended and specifications for the test should be documented.
(126)

For all 2018-2019 LEAP 2025 high school analyses, the Louisiana student population was used. In Section 6.3, the characteristics of calibration samples, such as subgroups, are discussed. Chapter 3 presents the test specifications. Information regarding reported data is discussed in detail in Chapter 7.

### 6.1 Classical Item Statistics

In this section, summary test statistics for each form and subject area of the LEAP 2025 high school tests are presented. These statistics are followed by item-level statistics for each subject area of the LEAP 2025 test. These statistics were produced using census data with first-time test takers. Students whose results were included in the item-level statistics summary needed to meet at least the following psychometric analysis criteria (note that the criteria used to filter data for item statistics analyses are slightly different than those used to produce students' performance statistics in this report):

- Student has total raw score in the data
- Student did not take administration error form
- Student did not take braille form
- Student did not take Spanish form
- Student's test score was not voided
- Student took the assessment for the first time (initial testers)
- Student finished all sessions
- Student's constructed-response items were scored

## Test-Level Statistics

Table 6.1 presents the number of items, score points, mean and standard deviation of the raw scores, and the average form difficulty for each subject for each administration. Form difficulty for a student was calculated by dividing the student's raw score by the total score points of the test.

As can be seen in the table, average form difficulty was similar in the fall and spring administrations. Average form difficulty in the summer administration was lower for all tests than in the fall and spring administrations, likely due to the fact that the summer form was a retest form. The average form difficulty for ELA ranged from 0.40 to 0.47 with the fall and spring administrations. The difficulty of the spring administration forms was 0.40 (Form D) and 0.45 (Form E) for English I and 0.40 (Form D) and 0.47 (Form E) for English II. The average form difficulty for mathematics ranged from 0.31 to 0.35 for the fall and spring administrations. The average form difficulty of the spring administration of mathematics was 0.32 (Form D) and 0.35 (Form E) for Algebra I and 0.31 (Form D) and 0.32 (Form E) for Geometry. In general, the 2019 LEAP 2025 High School tests were relatively difficult, and the mathematics tests were more difficult than the ELA tests.

Table 6.1 LEAP 2025 High School Means and Standard Deviations for Raw Scores and Form Difficulty

| Administration | Course | Form | Total Items* | Total Points | Mean Raw Score (Std. Dev.) | Average Form Difficulty (Std. Dev.) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Fall 2018 | English I | B | 34 | 94 | 41.64 (17.44) | 0.45 (0.13) |
|  | English II | B | 34 | 94 | 40.46 (16.78) | 0.44 (0.13) |
|  | Algebra I | B | 39 | 68 | 20.88 (9.73) | 0.31 (0.18) |
|  | Geometry | B | 38 | 68 | 22.60 (13.22) | 0.34 (0.18) |
| Spring 2019 | English I | D | 34 | 94 | 36.85 (17.69) | 0.40 (0.13) |
|  |  | E | 33 | 90 | 40.43 (16.86) | 0.45 (0.12) |
|  | English II | D | 34 | 94 | 37.18 (17.41) | 0.40 (0.11) |
|  |  | E | 33 | 90 | 41.88 (16.45) | 0.47 (0.11) |
|  | Algebra 1 | D | 39 | 68 | 21.36 (12.07) | 0.32 (0.16) |
|  |  | E | 39 | 68 | 22.98 (12.40) | 0.35 (0.16) |
|  | Geometry | D | 39 | 68 | 20.37 (12.52) | 0.31 (0.16) |
|  |  | E | 39 | 68 | 21.43 (12.39) | 0.32 (0.15) |
| Summer 2019 | English I | A | 33 | 90 | 27.47 (15.97) | 0.32 (0.12) |
|  | English II | B | 34 | 94 | 26.87 (16.37) | 0.30 (0.12) |
|  | Algebra I | BR | 39 | 68 | 17.62 (9.36) | 0.26 (0.17) |
|  | Geometry | BR | 38 | 68 | 20.35 (18.93) | 0.31 (0.14) |

*For English I and English II, each writing prompt component is counted as one item. The WE writing component is weighted in total points.

Table 6.2 presents the number of items, mean and standard deviation of the item $p$-values, and item-total correlations (i.e., item discrimination values) for each subject for each administration.

The mean $p$-value is the average of all item $p$-values in a specific subject area and administration. The mean item-total correlation $\left(R_{i t}\right)$ is the average of all item point-biserial correlations of a specific subject area. The $p$-value and item-total correlation are explained in the next section.

Table 6.2 LEAP 2025 High School $p$-Values and Item-Total Correlation ( $\mathrm{R}_{\mathrm{it}}$ ) Descriptive Statistics

|  |  |  |  | Item $p$-Value |  |  |  | Average Item-Total Correlation |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

*For English I and English II, each writing prompt component is counted as one item. The WE writing component is weighted in total points.

## Item-Level Statistics

Tables in Appendix G present the item statistics for each operational item included in the regular forms, organized by content area and administration. The tables include item number, $p$-value, item-total correlation ( $\mathrm{R}_{\mathrm{it}}$ ), omit rates, total N , adjusted N (adjusted N excludes omitted responses, responses that were not scored, or responses that received a non-score code), the percentage at each score point for polytomous items, and the percentage that chose each option for multiple-choice ( MC ) items. The summer administration population is not state representative, and the number of students was very small, so the interpretation of statistics in the summer administration should be done with caution.

## $p$-Value

The $p$-value is a measure of item difficulty. For an MC item, the $p$-value is calculated by dividing the number of students who correctly responded to an item by the total number of students who attempted the item. The value is reported as a proportion. For a non-MC item, the $p$-value is calculated by dividing the average score for the item by the maximum points possible. This value is also reported as a proportion.

In terms of $p$-values, test scores tend to be more precise when their average $p$-values are between the mid0.50 s and the low 0.70 s. However, it is important to select items based on content rather than on purely statistical criteria when building a criterion-referenced test. As shown in Table 6.2, the average $p$-values of the fall and spring administrations ranged from 0.35 to 0.49 . In the spring administration, Form $D$ tended to have lower $p$-values than Form E as Form D was administered when certain accommodations, such as text-tospeech, were required. The range of average $p$-values was lower in the summer administration, ranging from
0.30 to 0.35 . The average $p$-values of the English I and English II forms were higher than the average p-values of the Algebra I forms.

It is important that one examines the range of $p$-values, not just the average $p$-value, to determine whether a test measures well. It is desirable for a test to measure well throughout the range of skills present in the test form. That is, it is important that the items measure the performance of both low-scoring and high-scoring students, not just students in the center of the distribution. Having a range of $p$-values also helps to prevent floor and/or ceiling effects so that the test does not have large numbers of students at the minimum or maximum possible scores. The fall and spring English forms have items with $p$-values ranging from 0.20 to 0.83 (see Appendix G) and the summer English forms have items with p-values ranging from 0.08 to 0.69 . The $p$-values on the mathematics forms range from 0.05 to 0.89 (see Appendix G) for the fall and spring administrations and from 0.03 to 0.78 for the summer administration. Such a broad range of $p$-values, which indicates that the items measure well throughout the range of skill levels at a given grade, supports the accuracy of the LEAP 2025 high school test scores.

## Item-Total Correlations

An item-total correlation is the correlation between an item score and the total test score, where the item score is not included in the total score. It indicates how well an item differentiates between low-scoring and high-scoring students. In general, items with correlations below 0.20 are said to be poorly discriminating. The majority of the items on the LEAP 2025 High School forms had item-total correlations above this threshold. Any item with an item-total correlation below the 0.20 threshold was further analyzed to ensure that the item was correctly keyed.

## Omit Rates

The omit rate for each item indicates the percentage of students who did not answer the item. Omit rates can be used to examine possible speededness issues on tests. A test may be speeded if students do not have adequate time to answer all questions on the test. In general, an item is said to have a high omit rate if more than $5 \%$ of students failed to respond to the item. Evidence of speededness is considered a threat to validity because student test scores may not reflect their ability. Additionally, content validity may be threatened because the items that were not completed are needed to fulfill content blueprint specifications (Lu \& Sireci, 2007).

This examination of omit rates complies with Standard 4.14 of the Standards. This standard is concerned with the speededness of a test and states the following:

For a test that has a time limit, test development research should examine the degree to which scores include a speed component and should evaluate the appropriateness of that component, given the domain the test is designed to measure. (90)

The results in this section will show that, overall, student test scores are not adversely affected by the rate at which the students complete the test. In general, students have ample time to complete all sections of the test, and there is not a threat to construct or content validity.

The results presented in the Tables in Appendix G show that the percentage of students who omitted most of the items on the fall and spring LEAP 2025 High School tests was less than 5, suggesting that most students were able to complete the test in the prescribed amount of time. There were a small number of Algebra I and Geometry items that exceeded the omit rate of $5 \%$. This is likely due to the difficulty of the items, given that these items also have low $p$-values. Lu \& Sireci (2007) report that the Education Testing Service has used an
approach where a test was considered unspeeded if at least $80 \%$ of examinees reach the last item and all examinees reach at least $75 \%$ of the items. The reported omit rates fall within these ranges.

These item level statistics are reviewed at the beginning of the operational analysis process to ensure that items are not flawed, and a careful review is given to determine that the answer key is correct.

An MC item is reviewed during the key check process if

- it has a $p$-value less than 0.25 or more than .95 ,
- a greater number of high-performing students (top 20\%) are choosing a distractor than are choosing the key,
- the item-total correlation is less than 0.20,
- any of the incorrect answer options yields a positive distractor-total correlation, or
- the percentage of students omitting or not reaching each item is 5 or greater.

Other types of autoscored items are also flagged during the key check for review if the

- $\quad p$-value is less than 0.30 or more than .80 ,
- percentage of students who reached any possible score point is less than 3\%,
- item-total correlation is less than 0.30 , or
- percentage of students omitting or not reaching the item is $15 \%$ or greater.

## Item Response Theory (IRT)

Item parameters for items included in the LEAP 2025 High School tests were estimated using a marginal maximum-likelihood (MML) procedure and the 2-parameter logistic (2PL) model for MC items and the generalized partial credit (GPC) model (Muraki, 1992) for non-MC items. Under the 2PL model, the probability that a student with a trait or scale score of $\theta$ will respond correctly to MC item $j$ is

$$
P_{j}(\theta)=\frac{1}{1+\exp \left[-D a_{j}\left(\theta-b_{j}\right)\right]^{\prime}}
$$

where $D$ is $1.7, a_{j}$ is the item discrimination, and $b_{j}$ is the item difficulty. Under the GPC model, the probability that a student with a trait or scale score of $\theta$ will respond in category $x$ to partial-credit item $j$ is

$$
P_{j x}(\theta)=\frac{\exp \left[\sum_{k=0}^{x} D a_{j}\left(\theta-b_{j}+d_{j k}\right)\right]}{\sum_{h=0}^{m_{i}} \exp \left[\sum_{k=0}^{h} D a_{j}\left(\theta-b_{j}+d_{j k}\right)\right]},
$$

where $d_{j k}$ is the relative difficulty of score category $x$ of item $j$, and $m_{i}$ is the maximum item score for item $j$. The software IRTPRO (Cai, Thissen, \& du Toit, 2011) was used for the IRT calibrations. IRTPRO is a multipurpose program that implements a variety of IRT models associated with mixed-item formats and associated statistics. IRTPRO has been used to calibrate large data sets, such as those of PARCC and Smarter Balanced assessments. The program implements MML estimation techniques for items and MLE estimation of theta.

### 6.2 Calibration Sample

This section describes the calibration sample in adherence to Standard 1.8 of the AERA, APA, \& NCME (2014) Standards for Educational and Psychological Testing. Standard 1.8 states the following:

The composition of any sample of test takers from which validity evidence is obtained should be described in as much detail as is practical and permissible, including major relevant sociodemographic and developmental characteristics. (25)

Sample data was used for calibration with all subjects for the spring 2019 administration. Intact forms with established scoring tables were used for the fall and summer administrations, making calibration unnecessary. Since full census data was not available, the intention was to use data files that had at least 10,000 test takers for a form, or 20,000 test takers for a subject, scored to completion. The sample was evaluated using spring 2018 demographic information and student performance information to confirm that the sample was representative of the state's student population. Tables 6.3 and 6.4 show the representativeness of the calibration samples compared to the census data from the spring 2019 administration, including data for initial testers only. The census data in these tables included initial testers who received a scale score. With LEAP 2025 High School tests, psychometric analyses such as item calibration and item statistics are computed excluding re-testers since students taking the exam again are not representative of the general population. The calibration samples were representative of census data. The spring 2019 resampling strategy was successful in sampling a group that was representative of Louisiana students.

Table 6.3 Summary of Calibration and Census Data: Spring Administration Form D

|  |  | Calibration Sample |  | Census Data <br> Initial Testers Only |  |  |

### 6.3 Calibration and Linking

Item calibration and linking for the LEAP 2025 high school assessments were performed based on item response theory (IRT). The calibration and linking methodology used for the spring 2019 LEAP 2025 High School administration closely followed most of the PARCC methods referenced in the PARCC document Final Technical Report for 2015 Administration. To maintain comparability to PARCC, the 2PL/GPC IRT model was applied to item calibration using the software IRTPRO (Cai et al., 2011). To avoid local independence between traits, the writing traits written expression (WE) and knowledge and use of language conventions(WKL) were separately calibrated using the sparse matrix method.

The Stocking \& Lord (1983) procedure was applied using the transformation and scaling software STUIRT (Kim \& Kolen, 2004), which can be downloaded at http://www.education.uiowa.edu/centers/casma/computer-programs\#c0748e48-f88c-6551-b2b8-ff00000648cd. PARCC scale score transformation constants for the PARCC 2016 baseline scale were used to generate final scoring tables. All IRTPRO and STUIRT command files were prepared following PARCC examples. Descriptions of the PARCC calibration and equating approach can be found in the PARCC documents Final Technical Report for 2015 Administration (see https://eric.ed.gov/?q=source\%3A\"Partnership+for+Assessment+of+Readiness+for+College+and+Careers \%22\&id=ED599097) and Final Technical Report for 2016 Administration (see https://eric.ed.gov/?q=PARCC+Final+Technical+Report\&id=ED599197).

There were two CBT test forms per course for the spring administration. Table 6.5 summarizes the student count and item count by course.

The following steps were taken to place the 2018-2019 LEAP 2025 tests on the 2018 LEAP 2025 baseline scale:
1.1.1 Calibrate the LEAP 2025 High School tests.
1.1.2 Link the 2018-2019 LEAP 2025 High School tests to the 2018 LEAP 2025 baseline scale under the nonequivalent common item design.

PARCC established a new baseline scale using 2016 PARCC spring tests. The fall 2017 and spring 2018 LEAP 2025 High School tests were directly linked to this PARCC 2016 baseline scale using PARCC item parameters as anchor item parameters. Therefore, the fall 2017 and spring 2018 LEAP 2025 High School tests were placed on the PARCC scale. Since the fall 2017 and spring 2018 LEAP 2025 High School tests were calibrated with Louisiana students, the scale for the fall 2017 and spring 2018 LEAP 2025 High School tests will be referred to as the LEAP 2025 scale, although the scale was placed on PARCC scales built with PARCC associated states' data. Spring 2019 LEAP 2025 forms were linked to the LEAP 2025 scale using LEAP 2025 items, which were administered on LEAP 2025 forms in 2018-2019 as anchors by the Stocking \& Lord procedure. Since the 2019 anchor items are on the PARCC scale, future LEAP 2025 forms will continue to be considered on the PARCC scale.

## Calibration of the 2018-2019 LEAP 2025 Tests

For the LEAP 2025 item calibration, the 2PL/GPC IRT model was applied to the Louisiana students' calibration samples using the software IRTPRO (Cai et al., 2011). Table 6.5 shows the number of students in the calibration samples and the number of items. Spring calibration included samples of students that were representative of the general population. For English I and II, reading items (RL/RI) in the writing prompts are not counted in the N -Items column because the calibration does not include reading item scores; it only includes WE item scores. A RL/RI score and a WE item score for the same writing prompt are the same. There were thirty-two English items and thirty-nine mathematics items in both administrations. Common items
were included in forms $D$ and $E$, thus the total $N$-item per calibration for a course is less than the sum of the N -Items counts in each form.

Table 6.5 Summary of Student Count and Item Count

| Course | Form | N-Students | N-Items | Total <br> N-Items |
| :---: | :---: | :---: | :---: | :---: |
| English I | D | $\geq 13,800$ | 32 | 50 |
|  | E | $\geq 7,250$ | 32 |  |
| English II | D | $\geq 10,420$ | 32 | 50 |
|  | E | $\geq 8,410$ | 32 |  |
| Algebra I | D | $\geq 7,360$ | 39 | 62 |
|  | E | $\geq 5,750$ | 39 |  |
| Geometry | D | $\geq 6,800$ | 39 | 62 |
|  | E | $\geq 6,560$ | 39 |  |

Figure 6.2 illustrates the common items, equating item sets, and unique items per form. There are separate equating item sets for forms $D$ and $E$, and when combined, the set mirrors the form blueprint and is used to link to the 2018 LEAP 2025 scale. These across-year equating items were on forms D and E without overlap to mitigate item exposure as the LEAP 2025 assessment will use intact forms for future fall and summer administrations. The two forms were calibrated concurrently and the common items among forms allowed the forms to be on the same scale.

## Unique Items

Figure 6.3 illustrates how the 2018-2019 LEAP 2025 forms were linked to the 2018 spring administration. Both Equating Set 1 and Equating Set 2 from forms 1 and 2 (Forms D and E) were used together to obtain one set of Stocking \& Lord equating parameters.

Figure 6.3 LEAP 2025 HS Spring Administration Year-to-Year Equating

## Separate Calibration for ELA Prose Constructed-Response Tasks

For English I and II, the same sample repeated design was applied to the WE and WKL calibration to address the issue of local independence for ELA prose constructed response (PCR) tasks. For English I, for example, two datasets of responses were generated. One calibration dataset included two WE responses and the responses to the other items but excluded the WKL responses. The other calibration dataset included two WKL responses and the response of the other items but excluded the WE responses. Therefore, these datasets were the same except for WE and WKL items, and each dataset included either WE or WKL responses. After each dataset was separately calibrated, the item parameters with WKL responses were equated to those with WE responses using all common items as anchor items. Table 6.6 illustrates the calibration data structure for WE.

Table 6.6 Calibration Data Structure for ELA WE

| Form | Other Items | Unique WE | Common <br> Items | Common <br> WE | Unique <br> Form 2 <br> Items | Unique <br> WE |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $X X X X X X X X$ | $X$ | $X X X X X X X X$ | $X$ |  |  |
| 2 |  |  | $X X X X X X X X$ | $X$ | $X X X X X X X X$ | $X X X X X X X X$ |

## IRT Item Fit

The usefulness of IRT models is dependent on the extent to which they effectively reflect the data. Hambleton, Swaminathan, and Rogers (1991) explain, "The advantages of item response models can be obtained only when the fit between the model and the test data of interest is satisfactory. A poorly fitting IRT model will not yield invariant item and ability parameters" (p.53).

It is important to note that while items may be flagged for misfit, these flags may not be of practical importance. Misfitting items that have content validity are often retained for use in one assessment and monitored over a period of usage. A large number of misfitting items in an assessment would indicate that caution should be exercised in the interpretation of the overall score.

After convergence was achieved for each IRT data set, an item characteristic curve (ICC) for each item was plotted with empirical students' performances from theta ability -4 to 4 . No items were suppressed from
calibration due to poor fit. No items were removed from the anchor sets due to poor fit with the LEAP 2025 High School tests.

After calibration, the IRT model fit was evaluated by reviewing item chi-square values that were calculated using IRTPRO item parameters and item responses from students in the calibration sample. Adjusted fit values were calculated and flagged if they exceeded 0.35 (Pearson, 2017).

Since chi-square values are sensitive to sample size, these statistics are not easily compared when the number of students varies across items. As a result, adjusted fit values were calculated by dividing the chisquare fit statistic by the sample size using the following formula:

$$
C=\sqrt{\frac{\chi^{2}}{\chi^{2}+N}} .
$$

Table 6.7 shows the adjusted item fit C values using the chi-square statistics and calibration sample sizes for the English and mathematics content. The average adjusted fit ranged from 0.07 to 0.10 for the spring administration. No items were excluded based on model fit statistics because the adjusted item fits for all items were lower than the criterion value of 0.45 , as can be seen in the maximum values. The largest adjusted fit value was 0.28 for English I.

Table 6.7 Summary of Adjusted Fit for Spring Administration

| Course | N- <br> Items | Mean | Std. Dev. | Min. | Max. | N- Flagged <br> Items |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| English I | 50 | 0.10 | 0.06 | 0.03 | 0.28 | 0 |
| English II | 50 | 0.09 | 0.04 | 0.03 | 0.22 | 0 |
| Algebra I | 62 | 0.07 | 0.03 | 0.01 | 0.20 | 0 |
| Geometry | 62 | 0.07 | 0.04 | 0.01 | 0.21 | 0 |

## Linking 2018-2019 LEAP 2025 to PARCC Scale

This section explains the linking procedure used to place the LEAP 2025 High School spring 2019 administration onto the LEAP 2025 scale. The 2017-2018 fall and spring administrations were the first administrations of the LEAP 2025 High School tests, and the Stocking \& Lord procedure (1983) was used to link the LEAP 2025 tests to the PARCC scale using intact PARCC items embedded in the test forms. This yielded item parameters on the PARCC scale. The post-equated Louisiana item parameters were based on only Louisiana students' responses; therefore, to distinguish these two sets of item parameters, item parameters based on only Louisiana students' responses will be called LEAP 2025 item parameters and the corresponding scale will be called the LEAP 2025 scale.

Three anchor sets were used in the spring 2019 LEAP 2025 High School assessments equating process. One anchor set was used to link to the LEAP 2025 scale. The use of multiple anchor sets will assist in establishing comparability between the LEAP 2025 scale and the PARCC scale for current and future administrations.

Anchor 1 items were intact PARCC items embedded in the spring 2019 LEAP 2025 forms. Anchor 2 items were items common to the spring 2018 and the spring 2019 LEAP 2025 High School forms. These parameters were generated using Louisiana student data and were used to place the spring administration onto the LEAP 2025 scale. Anchor 3 item parameters consisted of all Anchor 2 item parameters, and Anchor 1 item parameters were used for the remaining items. Table 6.8 summarizes the number and score points of the initial anchor item selection before equating. Table 6.8 also summarizes the number and score points of the final anchor
item selections. The difference between the initial number of anchor items and the final number of anchor items is the number of anchor items that were dropped.

Table 6.8 The Number of Linking Items for Linking LEAP 2025 Spring 2019 to LEAP 2025 HS Spring 2018

| Course |  | Anchor 1 |  | Anchor 2 |  | Anchor 3 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Score <br> Points | N. of <br> Items | Score <br> Points | N. of <br> Items | Score <br> Points |  |
| English I | Initial | 44 | 97 | 14 | 31 | 44 | 97 |
|  | Final | 33 | 73 | 11 | 25 | 38 | 85 |

*Following OP2 approach for counting Writing dimensions: Count WE and WKL only
Table 6.9 presents the slope and intercept equating constants for each anchor set for each subject. The constants from Anchor 2 were used to bring the 2019 LEAP 2025 estimated parameters onto the LEAP 2025 scale.

Table 6.9 Stocking \& Lord Transformation Constants for Linking LEAP 2025 Spring 2019 to LEAP 2025 HS Spring 2018

| Course | Anchor 1 |  | Anchor 2 |  | Anchor 3 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Slope | Intercept | Slope | Intercept | Slope | Intercept |
| English I | 0.867933 | 0.161118 | 0.924291 | 0.089432 | 0.887791 | 0.069541 |
| English II | 0.882093 | 0.340173 | 0.911542 | 0.253819 | 0.886878 | 0.340465 |
| Algebra I | 1.006859 | -0.043168 | 0.991766 | 0.105916 | 1.007307 | 0.027138 |
| Geometry | 0.961210 | 0.049833 | 0.962862 | 0.211570 | 0.959705 | 0.096150 |

Figures 6.3 through 6.6 show test characteristic curves (TCCs) for the anchor items, the corresponding LEAP 2025 spring 2019 estimated anchor items before equating (ANC) and after equating (EQ_ANC), intact PARCC parameters (Pre_EQ), and all 2019 LEAP 2025 estimated items (EQ_ALL) for the LEAP 2025 High School Spring 2019 assessments after applying the Stocking \& Lord equating procedure. The blue solid line illustrates the pre-equated anchor items, the red dotted line is the 2019 LEAP 2025 equated anchor items, the black solid line is the form construction target (2018 LEAP 2025)., and the green dotted line and the brown solid line are the 2019 LEAP 2025 High School equated items from forms D and E, respectively. Anchor items for anchor sets 1,2 , and 3 are different as mentioned above. For all tests, the TCCs for anchor items and the corresponding 2019 estimated anchor items overlapped across most ability levels.

When anchor (blue) and pre-equated (black) TCCs are close to each other, it means the anchor value in the condition is similar to the TCC with parameters' pre-equated form. The anchor and pre-equated TCCs are closely overlapped with most tests with the Anchor 1 condition.

Pre-equated (black) and equated (green) TCCs overlapped closely with all tests with the Anchor 1 condition. Under the Anchor 2 condition, those TCCs were slightly farther from each other with English I and English II, indicating that equating results could differ if parameters from the fall 2017 administration of the LEAP 2025
assessments were used. The number of anchor items with Anchor 2 conditions is small, thus it is likely that the parameter difference as well as the limited number of anchor items resulted in the TCCs difference. To clarify, the results from Anchor 2 were used as the final equating results for the spring 2019 LEAP 2025 High School tests.

Figures 6.7 to 6.10 present scatterplots of slope item parameters and difficulty item parameters and their correlation after linking 2019 LEAP 2025 to the LEAP 2025 scale.

The parameters were mostly close to the identity line with Anchor 1, and the correlation ranged from 0.93 to 0.98. Most parameters were around the identity line with Anchor 2, as the anchor parameters were from Louisiana students, except the writing items in English I and English II. The correlation for Anchor 2 ranged from 0.95 to 0.98 .

Compared to English I and English II, Algebra I and Geometry item discrimination parameters were a little scattered from the identity line. It is usual to find higher correlations for difficulty parameters than those for slope parameters.

## Evaluation of Anchor Item Stability

Standard 5.15 requires that information about the anchors be presented, stating the following:
In equating studies that employ an anchor test design, the characteristics of the anchor test and its similarity to the forms being equated should be presented, including both content specifications and empirically determined relationships among test scores. If anchor items are used in the equating study, the representativeness and psychometric characteristics of the anchor items should be presented. (105)

One of the key requirements of anchor items in deriving valid reliable linking results is that the anchor items should form a miniature version of the test in terms of content coverage or test blueprint. Dropping flagged anchor items based solely on statistical criteria may change the content coverage and invalidate results. Before an anchor item may be dropped from an anchor set, the item characteristics, adequacy of the content coverage, and impact to the size of the anchor set should be evaluated.

Outliers of anchor items were reviewed with the Robust $Z$ (Huynh \& Meyer, 2010) and the weighted root mean square difference (WRMSD) method in addition to being reviewed from a content perspective, when reviewers considered aspects of the outliers such as the number of items and score points for each category and subcategory. If approved by LDOE, the outliers were dropped from anchor sets and considered to be common but non-anchor items during equating. The following evaluation rules were applied in order to check the quality of anchor items and the anchor set.

- Exclude CR items from anchor set if categories were collapsed due to small sample size.
- Exclude items with content or parameter estimation issues.
- Run Robust $Z$ method and remove flagged items from anchor set using the criterion value of |1.96|.
- Run STUIRT using the remaining items after Robust $Z$ is applied, and flag items for further inspection if the WRMSD is greater than the values in Table 6.10. If the items are flagged, then they are removed from the anchor set and the ICC was reviewed with the WRMSD (Kim \& Kolen, 2004).
- Flag outliers using the plots of slope and difficulty item parameters with their correlations (Kolen \& Brennan, 2014).
- Check score points and the numbers of items by category and subcategory before and after dropping an anchor item.

Huynh (2010) suggested applying a $z$ statistic that is robust under the presence of outliers. The robustification is established by replacing mean with median and standard deviation with interquartile range (IQR) for anchor items. A multiplicative constant (0.74) is applied to IQR to emulate the standard deviation of the normal distribution:

$$
Z=\frac{(D-M d)}{0.74 \times I Q R}
$$

where $D$ is the difference between intact and estimated item parameters of an anchor item and $M d$ is a median of differences between intact and estimated item parameters for all items. The critical value of $\pm 1.96$ is often used to evaluate estimated robust $z$ values.

The WRMSD values were calculated to compare to the ICCs using intact and estimated anchor item parameters. WRMSD is defined as

$$
W R M S D=\operatorname{SQRT}\left\{\sum_{Q=1}^{41} W_{Q}\left[\mathrm{ICC}_{Q}(E S T)-\operatorname{ICC}_{Q}(\text { INTACT })\right]^{2}\right\}
$$

where $Q$ represents a quadrature point (i.e., node), $W$ represents its weight given quadrature point $Q$ from IRTPRO output, INTACT represents intact PARCC item parameters, and EST represents estimated item parameters corresponding to intact PARCC item parameters. Table 6.10 summarizes WRMSD flagging criteria for inspection and possible removal of linking items.

Table 6.10 PARCC WRMSD Flagging Criteria

| Categories | Points | WRMSD/Points | WRMSD |
| :---: | :---: | :---: | :---: |
| 2 | 1 | 0.100 | 0.100 |
| 3 | 2 | 0.075 | 0.150 |
| 4 | 3 | 0.075 | 0.225 |
| 5 | 4 | 0.075 | 0.300 |
| 6 | 5 | 0.075 | 0.375 |
| 7 | 6 | 0.075 | 0.450 |
| $>=8$ | $>=7$ | 0.090 | 0.999 |

## Lowest and Highest Obtainable Scale Scores

A maximum likelihood (MML) procedure cannot produce scale score estimates for students with perfect scores or scores below the level expected when students are guessing. In addition, although MML estimates are available for students with extreme scores other than zero or perfect, occasionally these estimates have standard errors of measurement that are very large, and differences between these extreme values have little meaning. Therefore, scores are established for these students based on a rational but necessary nonMML procedure. These values, which are set separately by course, are called the lowest obtainable scale score (LOSS) and the highest obtainable scale score (HOSS). All LEAP 2025 High School content areas in 2018 used the same LOSS and HOSS values established by PARCC. The LOSS value was 650, and the HOSS value was 850.

## Category- and Subcategory-Level Subscores

A student's performance on the ELA reporting categories (i.e., reading and writing) is reported in one of three ratings: Strong, Moderate, or Weak.

Additionally, subcategory ratings are reported at the student level. English I and English II have three subcategories for reading (i.e., literary text, informational text, and vocabulary) and two subcategories for writing (i.e., written expression and knowledge and use of language conventions).

Algebra I and Geometry have four reporting categories. Category A, Major Content, is further reported at three subcategories in algebra I and two subcategories in Geometry. Category and subcategory performance are reported in one of three ratings: Strong, Moderate, or Weak.

Although the performance ratings are determined only by the items included within a category or subcategory, the level of knowledge and ability needed to achieve a performance rating is connected to the level of knowledge and ability required to reach the achievement levels in the overall test: a Weak rating requires similar knowledge and ability as the Unsatisfactory and Approaching Basic achievement levels, a

Moderate rating requires similar knowledge and ability as the Basic achievement level, and a Strong rating requires similar knowledge and ability as the Mastery or Advanced achievement levels.

The 2018-2019 LEAP 2025 High School reporting categories are summarized in Table 6.11.
Table 6.11 LEAP 2025 High School Reporting Categories

| Course | Category | Subcategory |
| :---: | :---: | :---: |
| English I/II | 1. Reading <br> 2. Writing | 1. Reading Informational Texts-RI <br> 2. Reading Literature-RL <br> 3. Reading Vocabulary-RV <br> 4. Written Expression-WE <br> 5. Written Knowledge of Language-WKL |
| Algebra I | 1. A-Major Content <br> 2. B-Additional and Supporting Content <br> 3. C-Expressing Mathematical Reasoning <br> 4. D—Modeling and Application | 1. A.1-Interpreting Functions <br> 2. A.2-Solving Algebraically <br> 3. A.3-Solving Graphically/Rate of Change |
| Geometry | 1. A—Major Content <br> 2. B-Additional and Supporting Content <br> 3. C-Expressing Mathematical Reasoning <br> 4. D—Modeling and Application | 1. A.1-Congruence Transformations/Similarity <br> 2. A.2-Similarity in Trigonometry/ Modeling and Applying |

Reading and writing category scores were produced for English I and English II. The reading category score range was 10-90 and the writing category score range was 10-60. The method for scaling the reporting category scores followed the PARCC methodology (Pearson, 2017). For the reading category, two theta score points corresponding to English I and English II scale scores of 725 and 750 were used for scaling. Linear transformation constants mapping the two theta points to the scale score points of 40 and 50 were calculated for the reading category. After these transformation values were applied to item parameters belonging to the reading category, a scoring table was generated using the TCC inverse method. A similar approach was applied to scale the writing category, using two scale score points of 30 and 35 . Two cut scores, 40 and 50 for reading and 30 and 35 for writing, were used to produce three performance-level ratings for each category (see Table 6.12 for cut scores for summatives, categories, and subcategories).

For mathematics categories and ELA and mathematics subcategories, only performance-level ratings were reported. Therefore, there is no need to scale them. Using the item parameters belonging to a given subcategory, a raw-score-to-theta scoring table is generated by applying the TCC inverse method. The two raw scores corresponding to $\theta_{\mathrm{L} 3}$ and $\theta_{\mathrm{L} 4}$ are cut scores for the subcategory.

Table 6.12 Cut Scores for Summative, Category, and Subcategory

| Performance <br> Level | Summative <br> Test | ELA Category |  | ELA Subcategory/ <br> Mathematics <br> Category/Subcategory |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Writing |  |
| 1 | 700 | 30 | 25 |  |
| 2 | 725 | 40 | 30 | $\theta_{\mathrm{L} 3}$ |
| 3 | 750 | 50 | 35 | $\theta_{\mathrm{L} 4}$ |
| 4 | Reading 800 |  |  |  |
| 5 | Around |  |  |  |

*Thetas are those from summative tests (i.e., 725 \& 750).
Note: Yellow highlight shows cut scores for category and subcategory.

### 6.4 Comparability: Form Equating

The primary purpose of form equating is to establish score equivalency between two (or more) forms. Equivalency is established by first building the forms to be equated according to tight content specifications. Then the form scores are placed on the same scale (by equating), such that students performing on two scaled assessments at the same level of underlying achievement should receive the same scale score on both forms, although they may not receive the same number-correct score (or raw score). The raw-to-scale-score relationship performs this leveling function based on form-equating studies. Theoretically, differences in the raw-to-scale-score relationship between the two forms can be partially due to differences in the samples utilized for calibration and differences in item difficulty. LDOE and DRC strive to maintain equivalent samples or use near-census samples over the years, minimizing the potential differences caused by the different samples. Differences in the raw-to-scale-score relationship, therefore, can be primarily attributed to the differences in item difficulty.

In the spring of 2019, the forms used were post-equated forms linking to the LEAP 2025 scale. The equating was conducted using the test characteristic transformation function method in the common-item non-equivalent-groups design (Stocking \& Lord, 1983). The fall 2018 and summer 2019 forms were intact forms.

Table 6.13 through Table 6.16 provide scale scores at selected percentiles that can be used to compare the distributional characteristics of the LEAP 2025 2018-2019 forms to previous administrations. Although these scale scores are rounded values, there were differences in the scale score values for a given percentile across the forms. These variations could arise for several reasons: (1) differences in the proficiency (i.e., achievement) of the students in the samples or growth in student achievement across years; (2) unevenness in the respective distributions that combine with the number-correct-to-scalescore scoring method, leaving "gaps" in the scale; or (3) other sources of equating error. Other sources of equating error can include subtle content differences between forms, handscoring differences, or unusual student samples. Some equating errors will always be present between forms. This means that the forms will not measure identically, even under optimal testing conditions. In general, however, the test characteristic function equating techniques will "level" the equated forms through the raw-to-scalescore adjustment.

| 70 | 744 | 751 | 749 | 750 | 753 | 712 | 717 |
| 65 | 740 | 746 | 746 | 746 | 750 | 709 | 714 |
| 60 | 736 | 742 | 742 | 742 | 746 | 709 | 710 |
| 55 | 732 | 736 | 738 | 738 | 742 | 705 | 710 |
| 50 | 727 | 731 | 734 | 734 | 738 | 705 | 706 |
| 45 | 724 | 729 | 731 | 731 | 733 | 705 | 706 |
| 40 | 722 | 724 | 727 | 729 | 731 | 701 | 701 |
| 35 | 716 | 721 | 724 | 726 | 728 | 701 | 701 |
| 30 | 712 | 715 | 721 | 723 | 725 | 696 | 696 |
| 25 | 709 | 711 | 718 | 719 | 722 | 696 | 696 |
| 20 | 705 | 707 | 715 | 716 | 719 | 696 | 690 |
| 15 | 701 | 702 | 707 | 712 | 711 | 691 | 690 |
| 10 | 696 | 697 | 702 | 707 | 706 | 685 | 684 |
| 5 | 691 | 692 | 697 | 694 | 701 | 678 | 676 |
| 1 | 678 | 677 | 677 | 675 | 686 | 670 | 666 |

Additional evidence of comparability can be found by reviewing the test characteristic curves (TCCs) for the spring 2018 and 2019 administrations of the LEAP 2025 assessments seen in Figure 6.12. For most content areas, the TCCs for the two years were similar across ability ranges. The English II content on Form E of spring 2019 was easier than on the spring 2018 and Form D of spring 2019 for high performing students. The Algebra I content spring 2019 forms was easier than on the spring 2018 form for high performing students. Overall, Geometry in spring 2019 was more difficult than in spring 2018. Note that this different difficulty is adjusted by reporting different scale scores given raw scores. A scale score of a difficult form is higher than that of an easy form given the same raw score.

Figure 6.13 shows SEMs for the Spring 2018 and 2019 LEAP 2025 HS assessments. For most content areas, the SEMs were similar across ability ranges, especially in the middle ability ranges.

### 6.5 Summary

In summary, the overall purpose of the operational data analyses is to ensure that the test items, as well as the overall test, are functioning appropriately. Operational data analyses also help maintain the test scale so that test results may be appropriately compared across years. The data analyses undertaken by DRC address multiple best practices of the testing industry but are particularly related to the following standards:

Standard 1.8 The composition of any sample of test takers from which validity evidence is obtained should be described in as much detail as is practical and permissible, including major relevant sociodemographic and developmental characteristics. (25)

Standard 4.14 For a test that has a time limit, test development research should examine the degree to which scores include a speed component and should evaluate the appropriateness of that component, given the domain the test is designed to measure. (90)
Standard 5.2 The procedures for constructing scales used for reporting scores and the rationale for these procedures should be described clearly. (102)

Standard 5.13 When claims of form-to-form score equivalence are based on equating procedures, detailed technical information should be provided on the method by which equating functions were established and on the accuracy of the equating functions. (105)

Standard 5.15 In equating studies that employ an anchor test design, the characteristics of the anchor test and its similarity to the forms being equated should be presented, including both content specifications and empirically determined relationships among test scores. If anchor items are used in the equating study, the representativeness and psychometric characteristics of the anchor items should be presented. (105)

Standard 7.2 The population for whom a test is intended and specifications for the test should be documented. If normative data are provided, the procedures used to gather the data should be explained; the norming population should be described in terms of relevant demographic variables; and the year(s) in which the data were collected should be reported. (126)

## Chapter 7: Test Results

This chapter of the technical report contains information on the results of the Spring LEAP 2025 High School administration of English I, English II, Algebra I, and Geometry. The scale score results and achievement level information are presented here. Presenting the results by achievement level translates the quantitative scale provided through scale scores into a qualitative description of student achievement. The levels are Advanced, Mastery, Basic, Approaching Basic, and Unsatisfactory.

While the scale score provides an essential quantitative reference for student achievement, the achievement level information plainly outlines the meanings of the scores to parents, students, and educators. When combined, scale scores and achievement levels provide a comprehensive set of tools to assess Louisiana student achievement by course.

This chapter also provides descriptions of the score reports, data structure, and interpretive guide for the LEAP 2025 administrations. The American Educational Research Association, American Psychological Association, and National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards for Educational \& Psychological Testing addressed in Chapter 7 are 5.1, 6.10, 7.0, and 12.18. Each standard is presented in the pertinent section of this chapter.

The results presented in this chapter are based on census data. The results presented here may differ slightly from the official state summary report of all student populations due to ongoing resolution of test materials and student information. The results in the tables in this chapter are presented as evidence of the reliability and validity of the scores from the LEAP 2025 high school ELA and mathematics assessments and should not be used for state accountability purposes.

### 7.1 Student Participation

The following are subgroups reported during the administration of the LEAP 2025 tests:

- Gender: Female and Male
- Race and Ethnicity: Hispanic/Latino, American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, White, and Two or More Races
- Education Classification
- Economic Status
- English Learner (EL)
- Migrant Status
- Homeless Status
- Military Affiliation
- Foster Care Status

The number of students who attempted each test, the number of students whose results were reportable from each test, and the number of students whose results were included in the technical report sample for each test are summarized by grade in Tables 7.1-7.4. The "Attempted" category includes all the students who attempted at least one item on the assessment. The "Reportable" category includes students who finished all sections in the assessment, which includes students in private school and home-study programs. The "Technical Report Sample" category represents the sample of students included in the analyses for this report, and they are the students who finished all sections of the assessment and counted toward the state total score; students in private school and home-study programs were excluded from this sample.

Table 7.1 Count of Students who Attempted, were Reportable, and Included in the Technical Report Sample: English I

| Administration | Group | Grade |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 6 | 7 | 8 | 9* | 10 | 11 | 12 | Total |
| Fall | Attempted | <10 | <10 | $\geq 20$ | 25,300 | $\geq 1,260$ | $\geq 180$ | $\geq 40$ | 26,810 |
|  | Reportable | <10 | <10 | $\geq 20$ | $\geq 5,220$ | $\geq 1,210$ | $\geq 180$ | $\geq 40$ | $\geq 6,690$ |
|  | Technical Report | <10 | <10 | $\geq 20$ | 25,220 | $\geq 1,210$ | $\geq 180$ | $\geq 40$ | $\geq 6,680$ |

Tables 7.21 through 7.24 summarize the mean scale scores, standard deviations, and the percentage of students in each achievement level for the 2018-2019 administration of the LEAP 2025 high school ELA and mathematics assessments. All three administrations are presented. Results from previous years are shown for comparison purposes.

Table 7.21 Comparison of Percentage of Students in Each Achievement Level: English I

### 7.2 Reports

Score reports are the primary means of communicating test scores to appropriate school system personnel (e.g., testing coordinators or superintendents), teachers, and parents. Standard 6.10 of the Standards states:

When test score information is released, those responsible for testing programs should provide interpretations appropriate to the audience. The interpretations should describe in simple language what the test covers, what scores represent, the precision/reliability of the scores, and how scores are intended to be used. (119)

Standard 5.1 is related to Standard 6.10. It states:
Test users should be provided with clear explanations of the characteristics, meaning, and intended interpretation of scale scores, as well as their limitations. (102)

Interpretations of test scores from each administration are disseminated in two ways: the individual score report and the LEAP Interpretive Guide.

In addition to providing interpretations of test results, the LDOE and DRC must ensure that those interpretations are understandable for the target audience. Standard 7.0 states:

Information relating to tests should be clearly documented so that those who use tests can make informed decisions regarding which test to use for a specific purpose, how to administer the chosen test, and how to interpret test scores. (125)

The LDOE and DRC strive to create documents that will be accessible to parents, teachers, and all other stakeholders.

The Individual Student-Level Report (ISR) is the primary means for sharing student test results with parents. As such, it is a stand-alone document from which parents can glean information that is relevant to understanding their children's test scores. For more information about the test, parents are provided Parent Guide to the LEAP 2025 Student Reports. In the 2018-2019 administration year, student reports for each school were posted by subject, then downloaded and printed from eDIRECT by the school systems and schools. eDIRECT is DRC's secure online system that provides schools and districts access to student tests and reports.

### 7.3 Description of Each Type of Report

In this section, descriptions of the School Roster Report and the ISR are provided.
In compliance with AERA, APA, \& NCME (2014) Standard 12.18, the LEAP 2025 score reports provide clear information about the results of individual students and of specific groups of students. Standard 12.18 states:

In educational settings, score reports should be accompanied by a clear presentation of information on how to interpret the scores, including the degree of measurement error associated with each score or classification level, and by supplementary information related to group summary scores. In addition, dates of test administration and relevant norming studies should be included in score reports. (200)

## School Roster Report

A School Roster Report, which provides summary information about student performance on the LEAP 2025 high school ELA and mathematics assessments, is available to school systems and schools through eDIRECT. Total test scores and achievement level indicators are shown for the test of interest. Category and subcategory performance ratings are also reported for students. At the school level, the percentage of students at each achievement level and rating by category and subcategory are summarized. More details can be found in the LEAP Interpretive Guide.

## Individual Student-Level Report

The ISR is another type of report available through the eDIRECT system. ISRs may be downloaded and printed by schools to be sent home to parents. At the top of the page, overall student performance is reported by scale score and achievement level. In the middle of the page, category and subcategory performance indicators are reported. When a student does not receive a scale score, his or her achievement level will be left blank. ISRs for students whose scores were invalidated will display a blank scale score for a given course.

A data file referred to as Louisiana Department of Education Student File (LDESTD) was provided to LDOE by DRC. It contains one record for every student tested; each record contains demographic information, responses for multiple-choice ( MC ) items, scores for items that are not MC items, raw scores, content and process standard raw scores, scale scores, and performance-level data for each content area.

The LEAP Interpretive Guide was written to help Louisiana school system and school administrators, teachers, parents, and the general public understand the LEAP 2025 ELA and mathematics tests. The LEAP Interpretive Guide was developed collaboratively by DRC and LDOE staff. LDOE staff had opportunities to review the guide, provide feedback, and give final approval.
The LEAP Interpretive Guide has three sections. The first section presents an introduction and an overview of key terms and test-related concepts. The second section discusses assessment terms and types of scores that are presented on the ISRs. Sample ISRs are included in the guide. The third section discusses information that is presented on the School Roster Report and an example of the report.

### 7.4 Summary

In summary, the overall purpose of reporting test results is to communicate information on student performance to stakeholders. These results are presented in the context of score reports that aid the user in understanding the meaning of the test scores. The reports and ancillary information developed by DRC address multiple best practices of the testing industry but are particularly related to the following standards:

Standard 5.1 Test users should be provided with clear explanations of the characteristics, meaning, and intended interpretation of scale scores, as well as their limitations. (102)

Standard 6.10 When test score information is released, those responsible for testing programs should provide interpretations appropriate to the audience. The interpretations should describe in simple language what the test covers, what scores represent, the precision/reliability of the scores, and how scores are intended to be used. (119)

Standard 7.0 Information relating to tests should be clearly documented so that those who use tests can make informed decisions regarding which test to use for a specific purpose, how to administer the chosen test, and how to interpret test scores. (125)

Standard 12.18 In educational settings, score reports should be accompanied by a clear presentation of information on how to interpret the scores, including the degree of measurement error associated with each score or classification level, and by supplementary information related to group summary scores. In addition, dates of test administration and relevant norming studies should be included in score reports. (200)

## Chapter 8: Performance-Level Setting

This chapter briefly describes the LEAP 2025 high school performance-level setting and presents the cut scores and achievement-level descriptors derived from the performance-level setting. Since the LDOE used PARCC cut scores for the LEAP 2025 high school tests, a brief overview of the PARCC performance-level setting procedures is included in this chapter. A more detailed discussion and the results of the PARCC performance-level setting may be found in the Performance Level Setting Technical Report (Pearson, 2015).

The AERA, APA, \& NCME (2014) Standards addressed by the Performance Level Setting Technical Report (Pearson, 2015) are 5.21 and 5.22.

Starting in the 2017-2018 administrations, the LEAP 2025 High School assessments measured different content and constructs than did previous tests administered to Louisiana students. The new tests were built using the PARCC item bank and were fully aligned to the Louisiana Student Standards. The new tests were reported on new scales, and students were classified by achievement levels based on their knowledge and ability to perform different tasks in relation to the new test content and standards.

In terms of the validity of the LEAP 2025 test scores, it is essential to understand that descriptors and cut scores are established in a collaborative and participatory process. The descriptors clearly establish, in plain language, the proper frame of reference for understanding how to interpret test scores, particularly cut scores.

### 8.1 PARCC Performance-Level Setting Process for English Language Arts and Mathematics

According to the Performance Level Setting Technical Report (Pearson, 2015), PARCC used the evidencebased standard setting (EBSS) method (Beimers, Way, McClarty, \& Miles, 2012) for the PARCC performance-level setting (PLS) process. The EBSS method is used to combine various considerations into the process for setting performance levels, including policy considerations, content standards, research, and educator judgment about what students should know and be able to demonstrate to support PARCC's policy goals related to college- and career-readiness expectations. Additional details about the EBSS method can be found in the Performance Level Setting Technical Report (Pearson, 2015).

### 8.2 Cut Scores

This section presents the cut scores for each grade and content area of the LEAP 2025 High School assessments. Table 8.1 summarizes the cut scores.

Table 8.1 LEAP 2025 High School Assessment Cut Scores

| Content | Approaching <br> Basic | Basic | Mastery | Advanced |
| :---: | :---: | :---: | :---: | :---: |
| English I | 700 | 725 | 750 | 791 |
| English II | 700 | 725 | 750 | 794 |
| Algebra I | 700 | 725 | 750 | 805 |
| Geometry | 700 | 725 | 750 | 783 |

### 8.3 Category Cut Scores

As stated in Chapter 6, section "Category- and Subcategory-Level Subscores," student performance on ELA and mathematics reporting categories and subcategories was classified into one of three performance ratings: Strong, Moderate, and Weak. Detailed rules for calculating performance ratings for ELA and mathematics categories and subcategories can be found in that section.

### 8.4 Achievement-Level Definitions

The cut scores divide the continuum of student achievement into the following five achievement levels used by LDOE for reporting purposes:

- Advanced: Students performing at this level have exceeded college- and career-readiness expectations and are well prepared for the next level of studies in this content area.
- Mastery: Students performing at this level have met college- and career-readiness expectations and are prepared for the next level of studies in this content area.
- Basic: Students performing at this level have nearly met college- and career-readiness expectations and may need additional support to be fully prepared for the next level of studies in this content area.
- Approaching Basic: Students performing at this level have partially met college- and careerreadiness expectations and will need much support to be prepared for the next level of studies in this content area.
- Unsatisfactory: Students performing at this level have not yet met the college- and careerreadiness expectations and will need extensive support to be prepared for the next level of studies in this content area.

Table 8.2 summarizes the LEAP 2025 High School scale-score ranges for each level of achievement.
Table 8.2 Achievement-Level Scale-Score Ranges

| Achievement Level | Unsatisfactory | Approaching <br> Basic | Basic | Mastery | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: |
| English I | $650-699$ | $700-724$ | $725-749$ | $750-790$ | $791-850$ |
| English II | $650-699$ | $700-724$ | $725-749$ | $750-793$ | $794-850$ |
| Algebra I | $650-699$ | $700-724$ | $725-749$ | $750-804$ | $805-850$ |
| Geometry | $650-699$ | $700-724$ | $725-749$ | $750-782$ | $783-850$ |

### 8.5 Summary

This chapter presented a brief overview of PARCC's performance-level setting process, which set the cut scores used by LDOE for reporting student performance on the LEAP 2025 High School tests. These procedures are addressed in more detail in relevant technical reports.

The performance-level setting process undertaken by PARCC addresses the following standards:
Standard 5.21 When proposed score interpretations involve one or more cut scores, the rationale and procedures used for establishing cut scores should be documented clearly. (107)

Standard 5.22 When cut scores defining pass-fail or proficiency levels are based on direct judgments about the adequacy of item or test performances, the judgmental process should be designed so that the participants providing the judgments can bring their knowledge and experience to bear in a reasonable way. (108)

## Chapter 9: Evidence of Construct-Related Validity

Evidence for construct-related validity—the meaning of test scores and the inferences they support—is the central concept underlying the LEAP 2025 validation process. Validity evidence, from the design of the test to item development and scoring, is created throughout the entire assessment process. Therefore, evidence of validity is described throughout the LEAP 2025 technical report. Table 9.1 summarizes the sources of validity evidence and indicates where the evidence can be found in the technical report.

Table 9.1 Evidence of Validity and the Corresponding Technical Report Chapter

| Source of Validity | Related Information | Related Chapter/Source |
| :---: | :---: | :---: |
| Evidence Based on Test <br> Content | Chapter 3 |  |

In this chapter, DRC presents evidence of construct-related validity through studies of test reliability, convergent validity, and divergent validity. All analyses in this chapter are based on census data.

Chapter 9 of this report demonstrates adherence to the American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \&

NCME, 2014) Standards 1.13, 1.21, 2.0, 2.3, 2.13, 2.14, 2.16, and 2.19. Each standard is discussed in the pertinent section of this chapter.

### 9.1 Construct-Irrelevant Variance and Construct Underrepresentation

Minimization of construct-irrelevant variance and construct underrepresentation is addressed in the following steps of the test development process: (1) specification, (2) item writing, (3) review, (4) fieldtesting, (5) test construction, and (6) item calibration (see Chapter 3 for more information on steps 1-5 and Chapter 6 for more information on step 6).

Construct-irrelevant variance refers to error variance that is caused by factors unrelated to the constructs measured by the test. For example, when tests are not administered under standardized conditions (e.g., one administration may be timed, but another administration is untimed), differences in student performance related to different administration conditions may result. Careful specification of content and review of the items representing that content are first steps in minimizing constructirrelevant variance. Then, empirical evidence, especially item-level data, is used to infer construct irrelevance.

Construct underrepresentation occurs when the content of the assessment does not reflect the full range of content that the assessment is expected to cover. Specification and review, a process through which test blueprints are developed and reviewed, are primary steps in the development process designed to ensure that content is appropriately represented.

### 9.2 Reliability

Reliability refers to the consistency of students' test scores on parallel forms of a test. A reliable test is one that produces scores that are expected to be relatively stable if the test is administered repeatedly under similar conditions. Often, however, it is impractical to administer multiple forms of the test, and reliability is estimated on a single administration of the test. This type of reliability, known as internal consistency, provides an estimate of how consistently examinees perform across items within a test during a single test administration (Crocker \& Algina, 1986). Reliability is a necessary, but not sufficient, condition of validity.

The 2014 Standards indicates the following:
The term reliability has been used in two ways in the measurement literature. First, the term has been used to refer to the reliability coefficients of classical test theory, defined as the correlation between scores on two equivalent forms of the test, presuming that taking one form has no effect on performance on the second form. Second, the term has been used in a more general sense, to refer to the consistency of scores across replications of a testing procedure, regardless of how this consistency is estimated or reported (e.g., in terms of standard errors, reliability coefficients per se, generalizability coefficients, error/tolerance ratios, item response theory (IRT) information functions, or various indices of classification consistency). (33)

In accordance with the Standards in developing and maintaining tests of the highest quality, DRC has calculated the reliability of each LEAP 2025 test in a variety of ways: reliability of raw scores, overall standard error of measurement (SEM), IRT-based conditional SEM, and decision consistency of achievement-level classifications.

There are several specific standards that this chapter addresses. These include Standards 2.0, 2.3, 2.13, and 2.19, each of which is articulated below.

Standard 2.0 Appropriate evidence of reliability/precision should be provided for the interpretation for each intended score use. (42)

Standard 2.3 For each total score, subscore, or combination of scores that is to be interpreted, estimates of relevant indices of reliability/precision should be reported. (43)

The total score reliabilities are discussed in Section 9.3 of this chapter. The category and subcategory reliabilities and SEMs are presented in Sections 9.11 and 9.4 and 9.11. The SEM of the total score is discussed in Section 9.4.

Standard 2.13 The standard error of measurement, both overall and conditional (if reported), should be provided in units of each reported score. (45)

The SEM based on raw scores is discussed in Section 9.3 and is reported in raw score units. The conditional SEM is discussed in Section 9.5 and is presented in scale score units.

Standard 2.19 Each method of quantifying the reliability/precision of scores should be described clearly and expressed in terms of statistics appropriate to the method. The sampling procedures used to select test takers for reliability/precision analyses and the descriptive statistics on these samples, subject to privacy obligations where applicable, should be reported. (47)

Section 9.3 discusses different ways of measuring test reliability, including reliability of raw scores and test-form SEM, IRT-based conditional SEM, and decision consistency of achievement-level classifications. These statistics were computed based on initial testers. Since the summer forms are primarily administered to students retesting, statistics for the summer form will not be reported. The summer form had been previously administered to a spring or fall population; therefore, the form's reliability information can be found in earlier technical reports. .

### 9.3 Test Reliability

The reliability of raw scores by test form was evaluated using Cronbach's (1951) coefficient alpha, which is a lower-bound estimate of test reliability. The reliability coefficient is a ratio of the variance of true test scores to the variance of the total observed scores, with the values ranging from 0 to 1 . The closer the value of the reliability coefficient is to 1 , the more consistent the scores, where 1 refers to a perfectly consistent test. In general, reliability coefficients that are equal to or greater than 0.8 are considered acceptable for tests of moderate lengths.

Cronbach's coefficient alpha was computed using the formula

$$
\begin{equation*}
\alpha=\frac{n}{n-1}\left[1-\frac{\sum_{i=1}^{n} \sigma_{i}^{2}}{\sigma_{X}^{2}}\right] \tag{9.1}
\end{equation*}
$$

where $n$ is the number of items on the test, $\sigma_{i}^{2}$ is the variance of item $i$, and $\sigma_{x}^{2}$ is the variance of the total test score.

Total test reliability measures, such as Cronbach's coefficient alpha and SEM, consider the consistency (i.e., reliability) of performance over all test questions in a given form, the results of which imply how well the questions measure the content domain and could continue to do so over repeated administrations. The number of items in the test influences these statistics; for example, a longer test can be expected to be more reliable than a shorter test.

The reliability coefficients for the fall and spring LEAP 2025 HS assessments are reported in Table 9.2. English I and English II have one writing component (RI or RL) that has the same score as another component (WE). The item score for the RI/RL writing component was excluded from the reliability computation. The reliability statistics ranged from 0.86 to 0.92 and from 0.90 to 0.91 for the fall and spring administrations, respectively. The two administrations had very similar reliability statistics. These results indicate acceptable reliability coefficients for the LEAP 2025 high school tests.

Table 9.2 Reliability

| Administration | Course | Form | Number of Items | Number of Score Points | SEM | Cronbach's Alpha | N-Count |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Fall 2018 | English I | B | 34 | 94 | 5.70 | 0.89 | $\geq 4,430$ |
|  | English II | B | 34 | 94 | 5.43 | 0.90 | $\geq 5,500$ |
|  | Algebra I | B | 39 | 68 | 3.68 | 0.86 | $\geq 3,130$ |
|  | Geometry | B | 38 | 68 | 3.82 | 0.92 | $\geq 4,730$ |
| Spring 2019 | English I | D | 34 | 94 | 5.55 | 0.90 | $\geq 45,850$ |
|  |  | E | 33 | 90 | 5.61 | 0.90 | $\geq 45,850$ |
|  | English II | D | 34 | 94 | 5.51 | 0.90 | $\geq 41,600$ |
|  |  | E | 33 | 90 | 5.60 | 0.90 | $\geq 41,600$ |
|  | Algebra I | D | 39 | 68 | 3.79 | 0.90 | $\geq 46,630$ |
|  |  | E | 39 | 68 | 3.73 | 0.91 | $\geq 46,630$ |
|  | Geometry | D | 39 | 68 | 3.64 | 0.91 | $\geq 35,680$ |
|  |  | E | 39 | 68 | 3.70 | 0.91 | $\geq 35,680$ |

The reliability statistics by subgroup are reported and discussed in Chapter 10.

### 9.4 Standard Error of Measurement

The reliability of reported test scores can be characterized by the standard errors associated with the scores. The SEM may be used to determine the range within which a student's true score is likely to fall. An observed score should be regarded not as a student's true score but as an estimate of a student's true score. It is expected that the score a student obtains from a single test administration would fall within one SEM of the student's true score $68 \%$ of the time and within approximately two SEMs of the true score $95 \%$ of the time. The SEM is an index of the random variability in test scores and is defined as follows:

$$
\begin{equation*}
\mathrm{SEM}=S D \sqrt{1-R_{x x^{\prime}}} \tag{9.2}
\end{equation*}
$$

where SD represents standard deviation of the raw score distribution, and $R_{x x^{\prime}}$ is estimated by $\hat{\alpha}$ as expressed in Equation 9.1.

The SEM at the test-form level was computed in raw score metric and is also presented in Table 9.2. With English I and English II, the raw score used to calculate the SD included the RI/RL component and weighting of WE.

### 9.5 Conditional Standard Error of Measurement

In contrast to SEM, conditional standard error of measurement (CSEM) expresses the degree of measurement error in scale score units and is conditioned on the ability of the student. DRC reports the CSEM in accordance with Standard 2.14, which states:

When possible and appropriate, conditional standard errors of measurement should be reported at several score levels unless there is evidence that the standard error is constant across score levels. Where cut scores are specified for selection or classification, the standard errors of measurement should be reported in the vicinity of each cut score. (46)

In further compliance with Standard 2.14, the CSEM of each cut score is reported in Table 9.3.
The CSEMs are defined as the reciprocal of the square root of the test information function and can be estimated across all points of the ability continuum (Hambleton \& Swaminathan, 1985). The CSEM is defined in the following equation:

$$
\begin{equation*}
\operatorname{CsEM}\left(\theta_{i}\right)=\frac{1}{\sqrt{I\left(\theta_{i}\right)}} \tag{9.3}
\end{equation*}
$$

where $I\left(\vartheta_{i}\right)$ is the test information function, as a sum of item information function 2 , obtained as

$$
\begin{equation*}
I\left(\theta_{i}\right)=\sum_{j} \frac{p_{i j}^{\prime}\left(\theta_{i}\right)^{2}}{p_{i j}\left(\theta_{i}\right) q_{i j}\left(\theta_{i}\right)} \tag{9.4}
\end{equation*}
$$

where $p_{i j}^{\prime}\left(\theta_{i}\right)$ is the derivative of $p_{i j}\left(\theta_{i}\right)$ and $q_{i j}\left(\theta_{i}\right)=1-p_{i j}\left(\theta_{i}\right)$.
Note that the CSEMs vary in magnitude across the entire range of student ability estimates (i.e., scale scores) and are smaller in the middle of the score distribution and larger at the tails. This pattern is expected when IRT methods are used. The CSEMs at the four cut scores that define the performance levels are presented in Table 9.3.

Table 9.3 Conditional Standard Errors of Measurement at the Approaching Basic, Basic, Mastery, and Advanced Cut Scores

|  |  |  | Approaching Basic |  | Basic |  | Mastery |  | Advanced |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Administration | Course | Form | Cut Score | CSEM | Cut Score | CSEM | Cut Score | CSEM | Cut Score | CSEM |
| Fall 2018 | English I | B | 700 | 11 | 725 | 9 | 750 | 9 | 791 | 10 |
|  | English II | B | 700 | 12 | 725 | 11 | 750 | 11 | 794 | 12 |
|  | Algebra I | B | 700 | 12 | 725 | 10 | 750 | 10 | 805 | 9 |
|  | Geometry | B | 700 | 11 | 725 | 7 | 750 | 6 | 783 | 6 |
| Spring 2019 | English I | D | 700 | 9 | 725 | 8 | 750 | 7 | 791 | 8 |
|  |  | E | 700 | 9 | 725 | 7 | 750 | 7 | 791 | 8 |
|  | English II | D | 700 | 10 | 725 | 9 | 750 | 9 | 794 | 10 |
|  |  | E | 700 | 10 | 725 | 9 | 750 | 9 | 794 | 10 |
|  | Algebra I | D | 700 | 14 | 725 | 11 | 750 | 9 | 805 | 9 |
|  |  | E | 700 | 14 | 725 | 11 | 750 | 9 | 805 | 8 |
|  | Geometry | D | 700 | 13 | 725 | 8 | 750 | 6 | 783 | 6 |
|  |  | E | 700 | 13 | 725 | 8 | 750 | 6 | 783 | 6 |

Figure 9.1 displays the CSEM curves for each subject area. With fixed-form assessments, the estimates of measurement error tend to be higher at the low and high ends of the scale-score range, where few items measure the ability levels. Generally, there are few students with extreme scores, and these score levels cannot be estimated as accurately as levels toward the middle of the ability range. The middle of the ability range, where cut scores are located, shows lower measurement error than the low and high ends of the ability ranges. Figure 9.1 demonstrates that the tests are designed so that measurement error is minimized in the middle of the scale range, where most students are located.

Figure 9.1 CSEM Curves for LEAP High School 2019

### 9.6 Classification Accuracy and Consistency <br> Classification Accuracy

Classification accuracy is defined as the extent to which the actual classifications of test takers into various achievement levels match classifications made based on their true scores (Livingston \& Lewis, 1995). Classification accuracy refers to the agreement between the observed score and the true score, whereas classification consistency refers to the agreement between two observed scores.

## Classification Consistency

Classification consistency is defined as the extent to which the classifications of students in a particular achievement level match based on two independent administrations of the same test form or one administration of two parallel test forms. It is often logistically infeasible, as well as expensive, to obtain data from repeated administrations of a test, be it re-administration of the same test or administration of a parallel form. Therefore, a common practice is to estimate classification consistency from one administration of a test.

The Livingston-Lewis (1995) methodology was used to calculate classification accuracy statistics based on the spring 2019 LEAP 2025 results. The Livingston-Lewis procedure utilizes a beta-binomial model that requires two steps: (1) fitting proportion-correct true scores to a four-parameter beta distribution and (2) using the binomial distribution to estimate classification accuracy and consistency. All calculations for classification accuracy and consistency are based on census data.

Classification consistency and classification accuracy conditioned on achievement level (sees Table 9.4 and 9.5) and on cut score (see Tables 9.6 and 9.7) are presented for the 2019 LEAP 2025 high school ELA and mathematics assessments in this section of the report. The magnitude of classification consistency and accuracy measures is influenced by several key features of a test's design, including the number of items, the location and number of cut scores, the score distribution, and the reliability and associated SEM. As seen in Table 9.4, classification accuracy conditioned on achievement level ranged from 0.00 to 0.85 . As seen in Table 9.5, classification consistency conditioned on achievement level ranged from 0.21 to 0.79 . For some mathematics tests, classification accuracy and consistency conditioned on the Unsatisfactory level were very low. A possible reason for these relatively low Unsatisfactory level values is the fact that there were not enough easy items to distinguish the Unsatisfactory level from the Approaching Basic performance level.

Table 9.4 Classification Accuracy Conditioned on Level of Achievement

| Classification Accuracy |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Administration | Course | Form | Unsatisfactory | Approaching Basic | Basic | Mastery | Advanced |

|  |  | E | 0.00 | 0.78 | 0.60 | 0.84 | 0.77 |
|  | Geometry | D | 0.00 | 0.80 | 0.70 | 0.85 | 0.75 |
|  |  | E | 0.00 | 0.80 | 0.69 | 0.85 | 0.75 |

Table 9.5 Classification Consistency Conditioned on Level of Achievement

| Classification Consistency |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Administration | Course | Form | Unsatisfactory | Approaching Basic | Basic | Mastery | Advanced |
| Fall 2018 | English I | B | 0.65 | 0.54 | 0.56 | 0.73 | 0.64 |
|  | English II | B | 0.70 | 0.48 | 0.49 | 0.66 | 0.71 |
|  | Algebra I | B | 0.44 | 0.49 | 0.47 | 0.75 | 0.60 |
|  | Geometry | B | 0.39 | 0.55 | 0.62 | 0.78 | 0.68 |
| Spring 2019 | English I | D | 0.69 | 0.51 | 0.56 | 0.71 | 0.60 |
|  |  | E | 0.65 | 0.54 | 0.58 | 0.71 | 0.61 |
|  | English II | D | 0.75 | 0.51 | 0.47 | 0.65 | 0.66 |
|  |  | E | 0.74 | 0.49 | 0.50 | 0.63 | 0.64 |
|  | Algebra I | D | 0.32 | 0.46 | 0.48 | 0.79 | 0.73 |
|  |  | E | 0.32 | 0.46 | 0.48 | 0.79 | 0.74 |
|  | Geometry | D | 0.21 | 0.57 | 0.60 | 0.77 | 0.72 |
|  |  | E | 0.21 | 0.57 | 0.59 | 0.78 | 0.70 |

Perhaps the most important indices for accountability systems are those for the accuracy and consistency of classification decisions made at specific cut points. To evaluate decisions at specific cut points, the joint distribution of all the performance levels is collapsed into a dichotomized distribution around that specific cut point. As an example, for the LEAP 2025 assessments, a dichotomization at the cut point between the Basic and Mastery classifications was formed. The proportion of correct classifications below this particular cut point is equal to the sum of all the cells at the Unsatisfactory, Approaching Basic, and Basic levels, and the proportion of correct classifications above this particular cut point is equal to the sum of all the cells at the Mastery and Advanced levels. Table 9.6 shows the classification accuracy statistics and Table 9.7 shows the classification consistency estimates when
conditioned on LEAP 2025 High School cut scores. Table 9.6 shows that classification accuracy at achievement cut points ranged from 0.86 to 0.98 . Table 9.7 shows that classification consistency conditioned at achievement cut points ranged from 0.81 to 0.98 . Classification consistency and accuracy at achievement cut points tend to be higher values than those conditioned on performance level.

The classification accuracy statistics are at or above 0.86 , while the classification consistency statistics are at or above 0.81 . These results suggest that consistent and accurate performance-level classifications are being made for students in Louisiana based on the LEAP 2025 High School assessments.

Table 9.6 Classification Accuracy at Achievement Cut Points

| Classification Accuracy |  |  |  |  |  |  |

### 9.7 Convergent Validity

Convergent validity is a subtype of construct validity that can be estimated by the extent to which measures of constructs that theoretically should be related to each other are, in fact, observed as related to each other. Analyses of the internal structure of a test can indicate the extent to which the relationships among test items conform to the construct the test purports to measure. For example, the LEAP 2025 geometry test is designed to measure a single overall construct-geometry achievement; therefore, the items comprising the LEAP 2025 Geometry test should measure only geometry, not language or reading.

This technical report summarizes additional statistics that contribute to construct validity (Cronbach's coefficient alpha is reported previously in this section, and item fit is reported in Chapter 6). The internal consistency coefficient (i.e., Cronbach's alpha) reported is typically measured via correlations among the test items and indicates the degree of the same general construct (Pearson, 2015, page 128). The reliability statistics shown in Table 9.2 are all above 0.89, indicating that items on the 2018 LEAP 2025 High School assessments are homogeneous. For a group of items to be homogeneous, the items must all measure the same construct (i.e., construct validity) or represent the same content domain (i.e., content validity). Because IRT models were used to calibrate test items and to report student scores, item fit is also relevant to construct validity. The extent to which test items function as the IRT model prescribes is relevant to the validation of test scores. As shown in Chapter 6, no items were flagged for poor model/data fit.

### 9.8 Principal Components Analysis

As another measure of construct validity, DRC examined the unidimensionality of each subject-level LEAP 2025 test. One of the underlying assumptions of the IRT models used to scale the LEAP 2025 tests is that the tests being calibrated are unidimensional; that is, items in each subject area measure a single content domain. For example, Algebra I items should measure algebra ability and not reading skills. Standard 1.13 of the Standards states:

If the rationale for a test score interpretation for a given use depends on premises about the relationships among test items or among parts of the test, evidence concerning the internal structure of the test should be provided. (26-27)

This section examines the internal structure of the LEAP 2025 tests by evaluating the unidimensionality assumption through principal components analysis (PCA). This analysis seeks evidence that there exists a single primary factor, the first principal component, which accounts for much of the relationship between items. The presence of a single or dominant factor suggests that a test is sufficiently unidimensional (i.e., that it measures one underlying construct).

A PCA was conducted for each subject of the LEAP 2025 assessments. A large first principal component is evident in each analysis. It is common to have additional eigenvalues greater than 1.0 , which may suggest the presence of other factors.

For the subjects of the LEAP 2025 assessments, the ratio of variance accounted for by the first factor to variance accounted for by the second factor is sufficiently large to indicate that the unidimensionality assumption holds. All the LEAP 2025 High School tests exhibit first principal components accounting for more than $20 \%$ of the test variance (

Table 9.8 through Table 9.11), except for the Algebra I spring 2019 administration. To further investigate the unidimensionality of the assessments, the ratio of the first eigenvalue to the second eigenvalue was found and is included in the row below the second component in each table. These ratios show that the first eigenvalue is at least four times as large as the second eigenvalue for all the LEAP 2025 assessments. This substantial difference in magnitude indicates that one factor appears to be dominant and that the LEAP 2025 High School tests are essentially unidimensional.

This evidence supports the claim that there is a dominant dimension underlying the items and tasks in each test and that scores from each test represent performance primarily determined by that ability. Construct-irrelevant variance, such as factual knowledge irrelevant to doing well in a subject, does not appear to create significant nuisance factors.

### 9.9 Analyses by Reporting Categories and Subcategories

Three sets of analyses were conducted at the reporting category and subcategory levels for ELA and mathematics content in another attempt to assess the construct validity of the LEAP 2025 assessments. First, correlation coefficients that measure the relationship between the category scores and subcategory scores were computed. Second, the reliability of each category and subcategory was computed. Finally, the SEM was computed for each reportable category and subcategory.

### 9.10 Correlations among Reporting Categories and Subcategories

This section reports the strength of the interrelationships among the reporting categories or subcategories by computing the correlation between them. Table 9.12 through Table 9.19 report the uncorrected Pearson product-moment (PPM) correlation coefficients, the PPM corrected for attenuation (CAPPM). The PPM among the categories and subcategories is presented below the
diagonal portion of the matrix, the CAPPM is presented above the diagonal portion of the matrix, and the reliability coefficients used are shown in Table 9.12 through Table 9.19.

The uncorrected PPM in Table 9.12 through Table 9.19 should be interpreted in the context of the reliability coefficient. In general, lower PPM coefficients are expected between variables that are less reliable. In most cases, the PPM coefficients show that performance on one category or subcategory is moderately to strongly related to performance on another category or subcategory within the same grade and content area. The value of the correlation coefficients will be affected by the limited number of items measuring each category or subcategory. Therefore, caution should be used when comparing the PPM coefficients that measure the relationships between categories or subcategories to those that measure the relationships between content areas. A more modest relationship (i.e., smaller correlation coefficients) is expected to be reported between the categories or subcategories as a consequence of the lower number of items measuring each of the reporting categories. The PPM between two category subscores, for example, may be artificially low because of measurement error.

The CAPPM is reported along with the PPM as indicated by Standard 1.21:
When statistical adjustments, such as those for restriction of range or attenuation, are made, both adjusted and unadjusted coefficients, as well as the specific procedure used, and all statistics used in the adjustment, should be reported. Estimates of the construct-criterion relationship that remove the effects of measurement error on the test should be clearly reported as adjusted estimates. (29)

The attenuation of the PPM can be corrected statistically using Spearman's formula:

$$
\begin{equation*}
C A P P M=\frac{r_{x y}}{\sqrt{r_{x x} r_{y y}}}, \tag{9.5}
\end{equation*}
$$

where $r_{x y}$ is the PPM between two categories or GLE strands, $r_{x x}$ is the reliability of one of those categories or GLE strands, and $r_{y y}$ is the reliability of the other category or GLE strand.

The English I and English II assessments show moderate relationships between the reading and writing categories, indicating that these two categories measure some different traits. Across all tables, the CAPPM indicates moderate or strong relationships between the subcategories. The CAPPM for reading vocabulary, written expression, and knowledge and use of language are moderate. In some cases, the CAPPM is greater than 1.0. "Disattenuated values greater than 1.00 indicate that measurement error is not randomly distributed" (Schumacker, 1996). The moderate or strong relationships suggested by the CAPPM in Table 9.12 through Table 9.19 are further evidence of the validity of the test construct. Since the overall content area is comprised of the category or subcategory subscores and the content area is expected to measure a single dimension, these subscores are expected to be moderately or highly related.

### 9.11 Reliability of Reporting Categories, or Subcategories

Raw score summary statistics (i.e., mean and standard deviation), Cronbach's (1951) coefficient alpha, and SEM were computed for each of the categories or subcategories by subject using the census data. These statistics are presented in Tables 9.18 through 9.22. Reliability indices, such as Cronbach's coefficient alpha (and resulting SEM), are a function of the number of items on a test, the average covariance between item pairs, and the variance of a test's total score. In general, it is expected that the coefficient alpha would be lower for a category or subcategory assessed by a small number of items than for a category or subcategory assessed by a larger number of items.

### 9.12 Standard Error of Measurement of Reporting Categories or Subcategories

 This chapter also reports the SEM associated with each of the categories and subcategories in Table9.20 through Table 9.27. These SEMs are reported in the raw score metric.Table 9.20 Mean, Standard Deviation, and Standard Error of Measurement (SEM) of English I Categories

### 9.13 Divergent (Discriminant) Validity

Measures of different constructs should not be highly correlated with each other. Divergent validity is a subtype of construct validity that can be assessed by the extent to which measures of constructs that theoretically should not be related to each other are, in fact, observed as not related to each other. Typically, correlation coefficients among measures of unrelated or distantly related constructs are examined in support of divergent validity.

To assess the divergent validity of the LEAP 2025 High School assessments, correlations were computed between the English I, English II, Algebra I and Geometry total scores for students who took more than one subject test in 2019. These correlations are based on the census data, and the results are shown in Table 9.28 and Table 9.29 for the fall 2018 and spring 2019 administrations respectively. The correlation coefficients ranged from 0.54 to 0.88 . The lowest correlation was observed between English II and algebra I in the fall 2018 administration, and the highest correlation was between English I and English II in the spring 2019 administration. Similar patterns were observed in both administrations. The correlation coefficients suggest that individual student scores across subjects are moderately related, indicating that these tests measure a similar knowledge base or general underlying ability while still measuring some different traits as planned.

Table 9.28 Inter-Correlation of HS Content Area Scale Scores in Fall Administration

|  | English I | English II | Algebra I | Geometry |
| :--- | :---: | :---: | :---: | :---: |

### 9.14 Summary

In summary, the overall purpose of establishing construct validity is to ensure that the interpretation of test scores is supported. Evidence of validity is necessary to justify the use of the LEAP 2025 test scores. This evidence addresses multiple best practices of the testing industry but particularly relates to the following standards.

Standard 1.13 If the rationale for a test score interpretation for a given use depends on premises about the relationships among test items or among parts of the test, evidence concerning the internal structure of the test should be provided. (26)

Standard 1.21 When statistical adjustments, such as those for restriction of range or attenuation, are made, both adjusted and unadjusted coefficients, as well as the specific procedure used, and all statistics used in the adjustment, should be reported. Estimates of the construct-criterion relationship that remove the effects of measurement error on the test should be clearly reported as adjusted estimates. (29)

Standard 2.0 Appropriate evidence of reliability/precision should be provided for the interpretation for each intended score use. (42)

Standard 2.3 For each total score, subscore, or combination of scores that is to be interpreted, estimates of relevant indices of reliability/precision should be reported. (43)

Standard 2.13 The standard error of measurement, both overall and conditional (if reported), should be provided in units of each reported score. (45)

Standard 2.14 When possible and appropriate, conditional standard errors of measurement should be reported at several score levels unless there is evidence that the standard error is constant across score levels. Where cut scores are specified for selection or classification, the standard errors of measurement should be reported in the vicinity of each cut score. (46)

Standard 2.16 When a test or combination of measures is used to make classification decisions, estimates should be provided of the percentage of test takers who would be classified in the same way on two replications of the procedure. (46)

Standard 2.19 Each method of quantifying the reliability/precision of scores should be described clearly and expressed in terms of statistics appropriate to the method. The sampling procedures used to select test takers for reliability/precision analyses and the descriptive statistics on these samples, subject to privacy obligations where applicable, should be reported. (47)

## Chapter 10: Fairness

As noted in the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014), there are varying definitions of fairness. This chapter examines fairness as it relates to minimizing bias on a test. This chapter also discusses test performance among varying subgroups assessed by LEAP 2025 assessments. It should be noted that having differences in test performance among subgroups does not mean that a test is unfair-it simply means that groups perform differently on a test. Even when a test is carefully and properly constructed, differences may exist among subgroups as a result of differences in curriculum or learning by students in the subgroups.

This chapter demonstrates how the Leap 2025 assessments adhere to AERA, APA, \& NCME Standards 3.1-3.6 and 3.16. These standards are from Chapter 3 of the Standards, which is titled "Fairness in Testing." Each of these standards is presented in this chapter.

Standard 3.6 states:
Where credible evidence indicates that test scores may differ in meaning for relevant subgroups in the intended examinee population, test developers and/or users are responsible for examining the evidence for validity of score interpretations for intended uses for individuals from those subgroups. What constitutes a significant difference in subgroup scores and what actions are taken in response to such differences may be defined by applicable laws. (65)

Test scores of examinee subgroups that differ in meaning are an ongoing concern in any large-scale testing program. To lessen the possibility of differences in test score meaning, DRC follows several steps in the item development and item selection processes, as is explained in Section 10.1 of this chapter. In addition, LDOE assessment research and development experts and Louisiana educators conduct content and bias reviews on items during the selection process, as explained in Chapter 3. These practices adhere to Standard 3.3, which states,

Those responsible for test development should include relevant subgroups in validity, reliability/precision, and other preliminary studies used when constructing the test. (64)

The PARCC consortium conducted differential item functioning (DIF) studies of their items prior to PARCC operational administrations. Items are typically evaluated for possible DIF in the field test phase of the test development process, and any items flagged for DIF are further examined to determine possible bias. During the ELA and mathematics test development process, DRC content experts tried to avoid including PARCC operational items flagged for DIF. Section 10.2 of this chapter explains the steps taken to evaluate LEAP 2025 items through the use of DIF to adhere to Standard 3.3.

In addition, the standardized test administration practices and the extensive training process for test score interpretation for LEAP 2025 comply with Standards 3.4 and 3.5, which state:

Standard 3.4 Test takers should receive comparable treatment during the test administration and scoring process. (65)

Standard 3.5 Test developers should specify and document provisions that have been made to test administration and scoring procedures to remove construct-irrelevant barriers for all relevant subgroups in the test-taker population. (65)

Section 10.1 of this chapter is also directly relevant to Standards 3.1 and 3.2.
Standard 3.1 Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population. (63)

Standard 3.2 Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests' being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics. (64)

This chapter explains the steps taken by DRC to minimize words, phrases, and content that may be regarded as offensive by members of particular demographic subgroups. Section 3.2 of Chapter 3 discusses the content and bias review conducted for LEAP 2025. This review is also critical in fulfilling Standards 3.1 and 3.2. In addition to the Louisiana-developed items, the PARCC operational items used in the 2019 LEAP 2025 forms were critical to the forms construction process. Refer to the New Meridian website for the bias and sensitivity guidelines used and the processes and procedures followed by PARCC pertaining to these items (see https://newmeridiancorp.org/).

The DIF and reliability analyses in this section are based on the CIA data described in Chapter 6. The impact analyses (scale score mean and standard deviation) are based on the technical report sample described in Chapter 7.

### 10.1 Minimizing Bias through Careful Test Development

The construction of a test that is fair for all examinees begins in the early stages of planning and development. The item and test development processes that were used to minimize bias are summarized below.

First, careful attention was paid to content validity during the item development and item selection processes. Bias can occur only if the test is measuring different things for different groups. The possibility of bias is reduced by eliminating irrelevant skills or knowledge from the items.

Second, item writers and test developers followed PARCC Fairness and Sensitivity Guidelines for reducing or eliminating bias. DRC test development staff reviewed all items and other testing materials with these guidelines in mind. Internal editorial reviews were conducted by at least three different people: a content editor who directly supervised the item writers, a style editor, and a content supervisor. The final test was again reviewed by people in these same roles and was also subjected to an independent review by LDOE assessment research and development specialists.

Third, careful attention was given to item statistics throughout the test development process. As part of the test assembly process, attempts were made to avoid using or reusing items with poor statistical fit or distractors with positive point biserial correlations, since these conditions may indicate that an item is testing a construct irrelevant to what being measured. DIF statistics were also examined during test construction. Items that had exhibited significant DIF against one or more subgroups were removed from further consideration unless it was essential to include them to meet content specifications.

### 10.2 Evaluating Bias through Differential Item Functioning (DIF) Statistics

After administering the test, an empirical approach known as DIF was used to examine the items. The DIF statistics (see Tables 10.1-10.4) indicate the degree to which members of a particular subgroup perform better or worse than expected on each item as compared to the reference group. The DIF procedures used
and the results of these analyses are detailed in this section. It should be noted, however, that all items included in LEAP 2025 were thoroughly reviewed for content and bias by LDOE and DRC content experts to ensure the items do not test knowledge or ability irrelevant to the construct the test intends to measure. Therefore, DIF flags do not necessarily indicate that an item is biased; rather, DIF flags indicate that the item functions differently for equally able members of different groups (Camilli \& Shepard, 1994). Items are not necessarily suppressed from operational scoring if they are flagged for DIF.

The position of DRC concerning test bias is based on two general propositions. First, students may differ in their background knowledge, cognitive and academic skills, languages, attitudes, and values. To the degree that these differences are large, no one curriculum and no one set of instructional materials will be equally suitable for all. Therefore, no one test will be equally appropriate for all. Furthermore, it is difficult to specify what amount of difference can be called large and to determine how these differences will affect the outcome of a particular test. Second, schools have been assigned the tasks of developing certain basic cognitive skills and supporting development of these skills equitably among all students. Therefore, there is a need for tests that measure the common skills and bodies of knowledge that are expected of all learners. The test publisher's task is to develop assessments that measure these key cognitive skills without introducing extraneous or construct-irrelevant elements into the performances on which the measurement is based. If these tests require that students have culturally specific knowledge and skills not taught in school, differences in performance among students can occur because of differences in student background and out-of-school learning. Such tests are measuring different things for different groups and can be called biased (Camilli \& Shepard, 1994; Green, 1975).

To lessen this bias, DRC strives to minimize the role of extraneous elements, thereby increasing the number of students for whom the test is appropriate. As discussed above and in Chapter 3 of this report, careful attention is given during the item development, test development and test construction processes to lessen the influence of these elements for large numbers of students. Unfortunately, these elements may continue to play a substantial role in some cases. To assess the extent to which items may be performing differently for various subgroups of interest, DIF analyses are conducted after each operational test administration.

DIF statistics are used to quantify differences in item performance between two groups after controlling for examinees' overall achievement level. Two DIF statistics that are commonly used for this purpose are the Mantel-Haenszel (MH) statistic (1959) and the standardized mean difference (SMD) between the reference and focal groups, proposed by Dorans and Schmitt (1991).

The MH statistic is computed as follows (Zwick, Donoghue, \& Grima, 1993):

$$
\text { Mantel } \chi^{2}=\frac{\left(\sum_{k} F_{k}-\sum_{k} E\left(F_{k}\right)\right)^{2}}{\sum_{k} \operatorname{Var}\left(F_{k}\right)}
$$

where $F_{k}$ is the sum of scores for the focal group at the $k$ th level of the matching variable. Note that the MH statistic is sensitive to $N$ such that larger sample sizes increase the value of chi-square.

In addition to the MH chi-square statistic, the delta statistic (MH-D DIF) was computed for all items. Educational Testing Service (ETS) first developed the MH-D DIF statistic. To compute delta, alpha (the odds ratio) is first computed as follows:

$$
\alpha_{M H}=\frac{\sum_{k=1}^{K} N_{r 1 k} N_{f 0 k} / N_{k}}{\sum_{k=1}^{K} N_{f 1 k} N_{r 0 k} / N_{k}},
$$

where $N_{r 1 k}$ is the number of correct responses in the reference group at ability level $k, N_{f o k}$ is the number of incorrect responses in the focal group at ability level $k, N_{k}$ is the total number of responses, $N_{f 1 k}$ is the number of correct responses in the focal group at ability level $k$, and $N_{\text {rok }}$ is the number of incorrect responses in the reference group at ability level $k$. MH-D DIF is then computed as follows:

$$
\text { MH-D DIF }=-2.35 \ln \left(\alpha_{M H}\right)
$$

For selected-response items, the $\mathrm{MH}\left(\chi_{M H}^{2}\right)$ statistic was used to evaluate potential DIF items. In the MH procedure, subgroups are matched by their raw total test score, using a contingency table with $K$ ability levels. When applying the MH procedure, the log-odds ratio $\alpha$ is assumed to be constant across the $K$ matched levels. The $\chi_{M H}^{2}$, then, estimates a pooled common-odds ratio. Taking the natural logarithm of the common-odds ratio and its confidence limits and multiplying these with the constant -2.35 may then allow the resulting values to be placed on the MH delta metric ( $\Delta_{M H}$ ) for interpretive purposes. Items were flagged for DIF using the following criteria:

1 Moderate DIF: Significant MH chi-square statistic (p<0.05) and $1.0 \leq \mid$ MH D-DIF $\mid<1.5$
2 Large DIF: Significant MH chi-square statistic ( $p<0.05$ ) and |MH D-DIF $\mid \geq 1.5$

For constructed-response items, an effect size (ES) statistic based on the MH chi-square will be used. The ES is obtained by dividing the SMD statistics by the standard deviation of the item. The SMD is an effect size index of DIF, which is relatively easy to interpret. The SMD compares the mean of the reference and focal group, adjusting for the distribution of reference and focal group members on the conditioning variable, which, for these analyses, is the LEAP 2025 raw score. The SMD is computed as follows (Zwick et al., 1993):

$$
S M D=p_{F k}\left(\sum_{k} m_{F k}-\sum_{k} m_{R k}\right),
$$

where $p_{F k}=$ the proportion of the focal group members at the $k$ th level of the matching variable, $m_{F k}=1 / N_{F 1 k}$, and $m_{R k}=1 / N_{R 1 k}$. Items are flagged using the same rules that are used in NAEP:

■ Moderate DIF: If the MH statistic is significant, ( $\mathrm{p}<.05$ ) and |ES| is between 0.17 and 0.25 .

- Large DIF: If the MH statistic is significant, ( $\mathrm{p}<.05$ ) and $|E S| \geq 0.25$.

A positive DIF value indicates that the item favors the focal group, while a negative value indicates that the item disadvantages the focal group.

## DIF Statistics for Demographic Groups

DIF analyses were conducted for groups defined by demographic characteristics. Tables 10.1 to Table 10.4 show the DIF results for the following subgroups:

Gender: Focal group is females; reference group is males.
Ethnicity: Focal groups are Hispanic/Latino, American Indian or Alaska Native, Asian, Black or African American, and two or more races; reference group is white.

Education Classification: Focal group is students who are classified as special education; reference group is all others.

English Learner Status: Focal group is students who are classified as EL; reference group is all others.
Economic Status: Focal group is students who are classified as economically disadvantaged; reference group is all others.

Section 504 Status: Focal group is students who are classified as Section 504; reference group is all others.
Homeless Status: Focal group is students who are classified as homeless; reference group is all others.
Military Affiliation: Focus group is students who are affiliated with the military; reference group is all others.
Foster Care Status: Focus group is students who are in foster care; reference group is all others.
A negative SMD value implies that the focal group has a lower mean item score than the reference group, whereas a positive value implies that the focal group has a higher mean item score than the reference group, conditioned on the matching test score.

The minimum case count for the focal group was set at 200, and the minimum case count for the reference group was set at 400. The DIF analyses are not performed for subgroups of less than 200 . In these cases, the statistical procedures do not have sufficient power to detect potential differences.

Tables 10.1 to Table 10.4 summarize the number of DIF flags for the spring 2019 administrations by subject for each focal group that included at least 200 students. Results are not reported (NR) for groups with an insufficient number of students. The analyses were conducted by test form. The fall 2018 and summer 2019 administrations used intact forms. Therefore, DIF was not computed.

The DIF statistics for Form D of English I (see Table 10.1) can be considered an example. On the English I form, a total of three items were flagged for DIF for the female subgroup; two of the five items had moderate positive DIF and one of the five exhibited large negative DIF. For the ethnicity categories, four items were flagged for moderate negative DIF—one item each for Hispanic/Latino and Asian and two items for Black or African American. Finally, three items were flagged for moderate negative DIF for the English Learner group.

Table 10.1 Spring 2019 Administration DIF Statistics of English I: Number of Flagged Items

| DIF Statistics |  |  |  | Count of Items at DIF Magnitude |  |  |  |

## DIF Statistics for Test Language

All items on one CBT form of the mathematics test are transadapted from English into Spanish.
Transadaptation takes into consideration linguistic and cultural differences and grade-level appropriate words. By accounting for these differences, the achievement of Spanish speakers can be measured in the same way as the achievement of English speakers. Please refer to Appendix E for more information about the transadaptation of Spanish mathematics forms. To help confirm that the test items can be measured similarly regardless of the language in which the items are published, a DIF set of analyses was performed. Two DIF analyses were performed using the 2019 LEAP 2025 mathematics operational items regardless of student count in the reference or focal group. Smaller counts for the groups needed to be tolerated since the overall count for those being administered the Spanish form was low.

For the first analysis, student responses for the shared operational items between 2018 and 2019 LEAP 2025 mathematics were combined. This approach increased the number of students who took the Spanish versions of the items. The Mantel-Haenszel (MH) and the Standardized Mean Difference (SMD) DIF procedures were performed on these common items. The second analysis focused on the items that were not shared between the 2018 and 2019 administrations. Although the MH and the SMD DIF procedures were performed on all 2019 LEAP 2025 operational items, the DIF flags were applied, where appropriate, to items that were not shared between 2018 and 2019.

For both analyses, DIF results were carefully reviewed whenever sample sizes were smaller than the required minimum sample size and when an item showed large (i.e., C) DIF. Table 10.5 summarizes how many items overall exhibited moderate or large DIF in mathematics.

Table 10.5 2019 LEAP 2025 DIF Statistics: Number of Flagged Items, Mathematics

| DIF Statistics: Mathematics |  |  |  | Count of Items at DIF Magnitude |  |  |  |

| Algebra I | 14 | Test Language | Spanish |  | 2 | 4 |  |
| Geometry | 16 | Test Language | Spanish |  | 1 | 1 |  |

### 10.3 Evaluating Bias through Impact Analysis

The impact of achievement testing on subgroups can be determined and reported in the form of average scores and also in terms of test score reliability.

Table 10.6 through Table 10.13 present the number of students and test form reliability statistics (i.e., coefficient alpha; see Chapter 9). Scale score means, standard deviations, and effect sizes (i.e., Cohen's d) for the various subgroups of interest are reported by form in Table 10.14 though Table 10.21

### 10.4 Reliability

Tables 10.6-10.13 show the test form reliability coefficients and SEM by student gender, ethnicity, education classification, economic status, EL status, migrant status, Section 504 status, homeless status, military affiliation, and foster care status. The reliability coefficients for English I and II forms ranged from 0.83 to 0.92 and from 0.85 to 0.94 for the fall 2018 and spring 2019 administrations, respectively. For algebra I and geometry, the reliability coefficients ranged from 0.71 to 0.93 and from 0.80 to 0.95 for the fall 2018 and spring 2019 administrations, respectively. These analyses show that the test reliability is of acceptable magnitude for all the subgroups. Note that the reliability coefficients are NR for subgroups with fewer than 10 students.

Table 10.6 Fall 2018 Administration English I Reliability and SEM by Subgroup

| Group | N Count | Cronbach's Alpha | SEM |

### 10.5 Effect Size

One way to evaluate the magnitude of the standardized mean difference (SMD) is to calculate the ES. Cohen's $d$ was used to calculate the ES and is given by the following formula:

$$
d=\frac{\overline{x_{a}}-\overline{x_{b}}}{\sqrt{\frac{\left(n_{a}-1\right) s_{a}^{2}+\left(n_{b}-1\right) s_{b}^{2}}{\left(n_{a}+n_{b}\right)-2}}},
$$

where $x_{a}$ is the mean score of group A, $x_{b}$ is the mean score of group B, $s_{a}^{2}$ is the variance of group A, $s_{b}^{2}$ is the variance of group $\mathrm{B}, n_{a}$ is the number of students in group A , and $n_{b}$ is the number of students in group B.

Cohen's $d$, then, expresses the difference in group means in terms of the standard deviation. For example, if $d=0.34$ for two groups, then it may be interpreted that the SMD between the two groups is 0.34 of the pooled standard deviation. Cohen (1988) offered guidelines for interpreting the meaning of the $d$ statistic: $d=0.20$ is a small $\mathrm{ES}, d=0.50$ is a medium ES , and $d=0.80$ is a large ES .

Using Cohen's (1988) guidelines, certain trends become apparent in Tables 10.14-10.21. Results are NR for subgroups with fewer than 10 students. For all subjects across both the fall and spring administrations, small differences in test scores were seen between females and males, with females slightly outperforming males. Mean scale scores and ESs show that Asian and white students tend to outperform other ethnicity groups across subjects. For most ELA and mathematics tests, there were clear performance differences between regular education and special education students in Education Classification and Not English Learner and English Learner in EL status.

Additional data for scale score means are provided in Tables 10.22 and 10.25. These tables report the number of students, scale score means, and standard deviations for each Special Education Classification. Groups that have fewer than 10 students are not reported (NR) in the tables.

### 10.6 Summary

In summary, the overall purpose of this chapter is to address fairness concerns that are relevant to the administration of LEAP 2025 assessments. The information in this chapter addresses multiple best practices of the testing industry and is particularly related to the following standards:

Standard 3.1 Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population. (63)
Standard 3.2 Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests' being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics. (64)

Standard 3.3 Those responsible for test development should include relevant subgroups in validity, reliability/precision, and other preliminary studies used when constructing the test. (64)
Standard 3.4 Test takers should receive comparable treatment during the test administration and scoring process. (65)

Standard 3.5 Test developers should specify and document provisions that have been made to test administration and scoring procedures to remove construct-irrelevant barriers for all relevant subgroups in the test-taker population. (65)

Standard 3.6 Where credible evidence indicates that test scores may differ in meaning for relevant subgroups in the intended examinee population, test developers and/or users are responsible for examining the evidence for validity of score interpretations for intended uses for individuals from those subgroups. What constitutes a significant difference in subgroup scores and what actions are taken in response to such differences may be defined by applicable laws. (65)
Standard 3.16 When credible research indicates that test scores for some relevant subgroups are differentially affected by construct-irrelevant characteristics of the test or of the examinees, when legally permissible, test users should use the test only for those subgroups for which there is sufficient evidence of validity to support score interpretations for the intended uses. (70)

## Appendix B-Item Content and Bias Review

## English Language Arts:

Educators reviewed items for passage set quality and overall grade-level appropriateness. Item-specific characteristics reviewed included content alignment; cognitive complexity; bias, fairness, and sensitivity; and technical design. For content alignment, educators reviewed items to determine if the item was aligned to the content and skills indicated in the associated standard(s). With regard to cognitive complexity, educators reviewed the items for grade-level appropriateness and appropriate range of difficulty. Educators also assigned a depth-of-knowledge (DOK) level based on Webb's DOK scale and analyzed each item for appropriate source of challenge, which indicates that the most difficult part of the item is indeed the skill defined in the standard the item is purported to measure. For bias, fairness, and sensitivity, educators reviewed items to ensure that barriers to successful performance on the test items were nonexistent or were removed via suggested revisions. For technical design the different parts of the items were analyzed to ensure that each functioned as it should.

## Mathematics:

Educators reviewed items for content alignment, cognitive complexity, difficulty, bias, fairness, and sensitivity, and technical design. For content alignment, educators reviewed the items to determine if the item was aligned to the LSSM and/or the LEAP 2025 Evidence Statements and was appropriate for the grade level. With regard to cognitive complexity, educators assigned a depth-of-knowledge (DOK) level based on Webb's DOK scale and analyzed each item for appropriate source of challenge to estimate a difficulty level (low, medium, high), to verify that the item only measured student mastery of the aligned standard and not some other irrelevant concept or skill. For bias, fairness, and sensitivity, educators reviewed items to ensure that barriers to successful performance on the test items were nonexistent or were removed via suggested revisions. Technical design referred to analyzing the different parts of the item to ensure that each functioned as it should.

## Summer/Fall 2018 Item Content and Bias Review Process

The newly-developed items available for field-testing are aligned to the Louisiana Student Standards for ELA and Mathematics and/or LEAP 2025 Mathematics Evidence Statements as determined by committees of Louisiana educators during the Summer/Fall 2018 LEAP 2025 High School Item Content and Bias Review. The process used to train educators on their role at the Item Review is outlined below.

1. Committee members attended a general session and received an overview of the process, which included:
a. Background of the review process that took place prior to acquired items being field-tested
b. Overview of purpose of the review:
i. To confirm content alignment of each item to designated Louisiana Student Standard
ii. To confirm grade appropriateness of each item
iii. To confirm cognitive complexity of each item
iv. To confirm the correct key(s) or response for each item
v. To confirm items are free of issues of bias, fairness, or sensitivity that could impact student responses to item
c. Overview of review process:
i. Committee members review each item individually and decide status of each item: accepted, accepted with revisions, or rejected.
ii. Group discusses and comes to consensus regarding status of each item.
iii. Items are either accepted or edited by group as needed.
iv. Items that are accepted or accepted with revisions are considered appropriate for future field-testing.
2. After the general session, committee members reported to their assigned committees, based on course.
3. Each group facilitator went over the review process again by first walking the group through the use of the review spreadsheet.
a. The ELA spreadsheet contained prepopulated columns of the following information for each item: item ID, passage, keys, primary, secondary, and tertiary standards (as applicable), and depth of knowledge.
b. The mathematics spreadsheet contained prepopulated columns of the following information for each item: ABBI ID, IDEAS ID, max points, Louisiana Student Standards for Math (LSSM)/LEAP evidence statement, secondary and tertiary standards (as applicable), estimated difficulty level (low, medium, high), cognitive complexity (depth of knowledge 1, 2, or 3), key, and item type.
4. The facilitator reviewed each column in the spreadsheet so committee members could better understand what information needed to be filled in.
5. The facilitator went over what each column represented to make sure all participants understood the information being presented.
6. The facilitator went over the columns to be filled in individually by each committee member as they reviewed an item (accept, accept with revisions, reject), and any comments they might have about the item.
7. The facilitator then reviewed the process to be used with each item.
a. For the first couple of items, the facilitator and committee members reviewed the item(s) together. They then came to group consensus as to the status of the items. Items were edited as necessary by the group.
b. When ready, committee members reviewed each item individually (facilitator indicated how many items to do before getting back together for group discussion of each item).
c. Once every member finished reviewing the assigned set of items, individuals shared the status they gave each item. Items were discussed one at a time until a status was assigned through group consensus to each item in a given set.
d. This process continued for all items taken to the item review.
e. Committee members were provided with an evaluation at the end of the meeting so that DRC and LDOE can make improvements for future item reviews.

## Universal Design

- Universal Design Principles make test items accessible for the widest range of the population possible. Some of these include:
- Use simple, common words instead of lowfrequency words when possible.
- Avoid irregularly-spelled words, words with ambiguous or multiple meanings, and technical terms unless they are defined and integral to the meaning.
- Ensure clarity of noun-pronoun relationships

## Bias and Sensitivity

- In order to have fairness in assessment, it is critical to ensure test materials are free of possible barriers to success among diverse groups of test takers
- Barriers can be reduced by ensuring items:
- do not measure irrelevant knowledge or skill
- do not anger, upset or distract test takers
- treat all groups of people with respect

## Most Common Forms of Bias

- stereotypical representations
- geographical bias
- socioeconomic bias
- religious bias
- gender bias
- linguistic bias
- exclusion or underrepresentation of groups

## Table B.1. LEAP 20252018 Item Content and Bias Review Totals

| Content |  |  |  |  |  |  |  |

## Appendix C—Accommodated Print Form Creation

## Guidelines for Building Accommodated Print Forms

Careful consideration is given to all items that are used for accommodated print (AP) forms and/or braille forms. Fairness for all populations, item integrity, and student-item interaction for technology-enhanced (TE) items are all factors when selecting the items that will appear on an AP form. TE items are modified so that students who interact with an item on an AP form will have a similar experience to students who interact with that same item in the online environment. This maintains both the rigor and the content being assessed. Some examples of the modification process are provided below.

- Drag-and-drop items in the online environment require a student to place the answer options in an interactive table. For the AP form, the student is presented with a table with the same information as the interactive table (column or row headers, any completed cells, and blank spaces) and the answer options are listed below the table (similar to the online form in which the options are listed either below or to the right of the table). The directions are modified to ask the student to write the correct answer in its corresponding box. Students are also able to circle the text and draw arrows to indicate where it should be placed or add labels to the answer choices and write only the label in the box, as long as the intended response is clear to the test administrator who will transcribe the answers into the online system.
- Matching items in the online environment require a student to select a checkbox in one or more columns for each of multiple rows. In the AP form, the student is provided with a table and asked to mark an $X$ in the correct places.
- Highlight-text items or item parts in the online environment require a student to click on the selected text, which highlights the selected word, phrase, or sentence. In the AP form, the text is presented in the same format and the student is asked to circle the answer. Where only certain words or phrases are selectable in the online system, those options are underlined in the AP form to indicate which words and/or phrases the student should select from.
- Drop-down menu items in the online environment have answer options in a drop-down menu format, oftentimes as part of a complete sentence. The AP form displays the item with a blank line in place of the drop-down menu in the sentence, with all the answer options for the drop-down menu presented vertically below the sentence. The directions are then modified to ask the student to circle the word/phrase that belongs in the blank.
- Short answer items in the online environment require a student to type the answer in a box. In the AP form, a box is provided for the student to write the response.
- Keypad input items in the online environment require a student to enter a numeric response including all rational and irrational numbers as well as expressions and equations. In the AP form, a box is provided for the student to write the response.
- Graphing items, including coordinate planes, number lines, line plots, and bar graphs, in the online environment require a student to complete a graph by plotting points, adding $X$ s to create a line plot, or raising/lowering bars to create a bar graph or histogram. In the AP form, the student is provided with the same coordinate plane, number line, line plot, or bar graph as in the online item, including titles, axis labels, and keys, and is asked to complete the graph.

Displaying items similarly in both accommodated print forms and the online environment (and allowing students to interact with the items in a similar manner) maintains item integrity by assessing a similar
construct in a similar manner regardless of where a student encounters an item. This provides students who are unable to access the assessment online with an assessment at the same level of rigor as the online test.

AP forms are thoroughly reviewed by DRC and LDOE content experts to ensure a valid and reliable assessment for students who are unable to participate in the online assessment. These forms are also used as the source files for the creation of braille forms.

## Appendix D—Item Alignment Review Process

The acquired items available for use on forms are aligned to the Louisiana Student Standards for ELA and Mathematics and/or LEAP 2025 Mathematics Evidence Statements. Their alignment was determined by committees of Louisiana educators during the June 2018 LEAP 2025 High School Item Alignment Review. The process used to train educators at the Item Alignment Review is outlined below.

1. Committee members attended a general session and received an overview of the process, which included the following:
a. Background on items and the review process that took place prior to acquired items being field-tested
b. Overview of the purpose of the alignment review
i. To confirm the content alignment of each item to a designated Louisiana State Standard
ii. To confirm the grade appropriateness of each item
iii. To confirm that items are free of issues of bias, fairness, or sensitivity that could impact student responses to each item
c. Overview of the process itself
i. Committee members will review each item individually and decide the status of each item. The status of each item could be "accepted with current alignment," "accepted with realignment," or "rejected."
ii. The group will discuss the items and come to a consensus regarding the status of each item.
iii. Items that appropriately measure the intended standard and/or evidence statement and are free of issues of bias, fairness, or sensitivity that could impact student responses are accepted and considered appropriate for inclusion in LDOE item bank.
2. After the general session, committee members reported to their committees, which were assigned based on course.
3. Each group facilitator went over the review process again by first walking the group through the use of the review spreadsheet.
a. The ELA spreadsheet contained prepopulated columns with the following information for each item: item ID, passage, keys, primary, secondary, and tertiary standards (as applicable), and depth of knowledge.
b. The mathematics spreadsheet contained prepopulated columns with the following information for each item: ABBI ID, IDEAS ID, maximum points, Louisiana Student Standards for Mathematics (LSSM)/LEAP evidence statement, secondary and tertiary standards (as applicable), estimated difficulty level (low, medium, high), cognitive complexity (depth of knowledge 1, 2, or 3), key, and item type.
4. The facilitator reviewed each column in the spreadsheet.
a. The facilitator went over what each column represented to make sure all participants understood the information being presented.
b. The facilitator went over the columns to be filled in individually by each committee member as they reviewed an item (accept with current alignment, accept with realignment, reject), and the place in the spreadsheet for any comments they might have about the item. If
committee members did not agree with an alignment, they were asked to propose a new alignment, if possible.
5. The facilitator then reviewed the process to be used with each item.
a. For the first couple of items, the facilitator and committee members reviewed the item and its alignment(s) together. They then came to group consensus as to the status of the items.
b. When ready, committee members reviewed each item individually (the facilitator indicated how many items to do before getting back together for the group discussion of each item).
c. Once every member finished reviewing the assigned set of items, individuals shared the status they gave each item. Items were discussed one at a time until a status was assigned to each item in a given set through group consensus.
d. This process continued for all items taken to the item alignment review.
e. Committee members were provided with an evaluation at the end of the meeting so that DRC and LDOE could make improvements to future item alignment reviews.

## Appendix E—Transadaptation Process for Spanish Mathematics Forms

For English Learners, the LDOE offers the mathematics assessments in Spanish for computer-based tests (CBTs) in order to mirror the English language forms and the text-to-speech (TTS) forms. The Spanishlanguage versions of the test were developed through transadaptation. Transadaptation takes into consideration the grade-level appropriateness of the words and sentence structures used and the linguistic and cultural differences that exist between speakers of two different languages. Accounting for these differences allows experts to ensure that a Spanish-language version of an item will measure the same construct as the English-language version of the item at the same level of rigor. The item is, therefore, expected to measure the achievement of English Learners in the same way that the English version of the item does for native speakers of English.

Once the operational form was approved in English, DRC provided item IDs for acquired items to New Meridian, who then identified which of those items had previously appeared on a Spanish transadapted form. Once New Meridian identified the items that had previously been transadapted and provided the transadaptations of those items, DRC identified the English version of all items that had not been previously transadapted (either because they were Louisiana-owned items that would appear in field-test positions or because they were acquired items that had not been previously used on a PARCC Spanish-language form). These items were then provided to the Spanish transadaptation subcontractor for initial transadaptation. DRC's Spanish Test Development team (who are all native Spanish speakers) reviewed the previously transadapted items to ensure consistency between those items transadapted as part of the PARCC assessments and those transadapted specifically for Louisiana. The team provided guidance to the translator conducting the initial transadaptation in grade-level and culturally appropriate ways. Upon completion of the transadaptation by the subcontractor, DRC's Spanish Test Development team conducted reviews by native Spanish speakers for content and grade-level appropriateness of the transadaptation. The team also conducted an editorial review. At least two members of DRC's Spanish Test Development team compared each English item to the Spanish transadaptation to ensure that the transadaptation

- was accurate;
- contained grade-appropriate wording;
- contained answer choices that were reasonably parallel;
- did not introduce ambiguity into the Spanish version;
- contained graphics that were clearly transadapted;
- did not alter current teaching and learning practices in the content area; and
- remained free of gender, ethnic, cultural, socioeconomic, and regional bias.

The Spanish Test Development team then reconciled any discrepancies and submitted the transadaptations to a senior Spanish Test Development team member for resolution. After approval by the senior Spanish Test Development team member, the item moved forward to be imported into DRC's item banking system.

Both previously transadapted items and newly transadapted items were imported into DRC's item banking system and formatted for online use. Each Spanish item was paired with the corresponding English item in the item bank, and the Spanish item was formatted. Graphics for the item were then finalized for review. The
finalized transadaptation was then compared to the Spanish version of the item in the DRC assessment system and the English version of the item, and all changes were verified.

DRC's Spanish Test Development team then used the final, approved communication assistance scripts in English to transadapt descriptions of graphics as necessary. These descriptions were used when preparing the TTS forms for review. Scripting the TTS forms and reviewing the finalized Spanish forms were conducted by native Spanish speakers at DRC prior to submitting the forms to the LDOE for a translation review by a thirdparty translation vendor. The vendor reviewed the transadapted forms and provided feedback to the LDOE and DRC. Experienced DRC Spanish Test Development team members and the translation vendor resolved any issues, and DRC made modifications as necessary. The forms were then approved by both DRC and the LDOE translation vendor.

## Schedule, Locations, and Staffing

All reader training and handscoring for the spring 2019 administration of LEAP 2025 grades 3-8 and high school assessments and End-of-Course (EOC) high school assessments will take place at the DRC scoring center locations noted in the table below.

## Training and Scoring Schedule

DRC's reader training and scoring schedule is based on the spring testing windows of April 1, 2019 - May 3, 2019 (LEAP 2025 grades 3-8) and April 15, 2019 - May 17, 2019 (LEAP 2025 and EOC high school). Reader training and scoring locations and the anticipated dates for each are noted below.

| Grade/Content Area or Course | DRC Scoring <br> Center <br> Location | Anticipated Staffing | 2019 Reader <br> Training and Scoring Window |
| :---: | :---: | :---: | :---: |
| 3 ELA | Columbus, OH | 2 Scoring Directors, 5 Team Leaders, 55 Readers | May 9 - June 5 |
| 4 ELA | Madison, WI | 2 Scoring Directors, 6 Team Leaders, 60 Readers | May 9 - June 5 |
| 5 ELA | Madison, WI | 2 Scoring Directors, 4 Team Leaders, 45 Readers | April 4-May 10 |
| 6 ELA | Plymouth, MN | 1 Scoring Director, 1 Team Leader, 13 Readers | April 1-May 10 |
| 7 ELA | Plymouth, MN | 2 Scoring Directors, 4 Team Leaders, 30 Readers | April 1-May 10 |
| 8 ELA | Atlanta, GA | 2 Scoring Directors, 4 Team Leaders, 30 Readers | April 4-May 10 |
| 3 Math | Woodbury, MN | 2 Scoring Directors, 6 Team Leaders, 60 Readers | May 9 - June 5 |
| 4 Math | Plymouth, MN | 2 Scoring Directors, 4 Team Leaders, 40 Readers | May 13 - June 5 |
| 5 Math | Sharonville, OH | 2 Scoring Directors, 4 Team Leaders, 40 Readers | April 4-May 10 |
| 6 Math | Lake Mary, FL | 2 Scoring Directors, 5 Team Leaders, 50 Readers | April 4-May 10 |
| 7 Math | Woodbury, MN | 2 Scoring Directors, 5 Team Leaders, 50 Readers | April 4-May 10 |
| 8 Math | Sharonville, OH | 2 Scoring Directors, 5 Team Leaders, 50 Readers | April 4-May 10 |
| 3 Science | Indianapolis, IN | 2 Scoring Directors, 5 Team Leaders, 55 Readers | May 9 - June 5 |
| 4 Science | Indianapolis, IN | 2 Scoring Directors, 9 Team Leaders, 90 Readers | May 9 - June 5 |
| 5 Science | Atlanta, GA | 2 Scoring Directors, 6 Team Leaders, 55 Readers | April 4-May 10 |
| 6 Science (CRs) | Indianapolis, IN | 1 Scoring Director, 4 Team Leaders, 40 Readers | April 4-May 10 |
| 6 Science (ERs) | Indianapolis, IN | 1 Scoring Director, 3 Team Leaders, 25 Readers | April 1-May 10 |
| 7 Science | Indianapolis, IN | 2 Scoring Directors, 7 Team Leaders, 65 Readers | April 4 - May 10 |
| 8 Science (CRs) | Atlanta, GA | 1 Scoring Director, 3 Team Leaders, 30 Readers | April 4-May 10 |
| 8 Science (ERs) | Plymouth, MN | 1 Scoring Director, 3 Team Leaders, 30 Readers | April 3-May 10 |
| 3 SS | Atlanta, GA | 1 Scoring Director, 2 Team Leaders, 20 Readers | May 13 - June 5 |
| 4 SS | Atlanta, GA | 1 Scoring Director, 2 Team Leaders, 20 Readers | May 13 - June 5 |
| 5 \& 6 SS (CRs only) | Atlanta, GA | 1 Scoring Director, 4 Team Leaders, 40 Readers | April 1-May 10 |
| 7 \& 8 SS (CRs only) | Atlanta, GA | 1 Scoring Director, 4 Team Leaders, 40 Readers | April 1 - May 10 |
| 5, 6, 7, \& 8 SS (ERs only) | Plymouth, MN | 1 Scoring Director, 4 Team Leaders, 40 Readers | April 3 - May 10 |

| LEAP 2025 U.S. History | Plymouth, MN | 1 Scoring Director, 4 Team Leaders, 40 Readers | April 10 - May 22 |

Each DRC scoring center is a secure facility. Access to scoring centers is limited to badge-wearing staff and to visitors accompanied by authorized staff. All readers are made aware that no scoring materials may leave the scoring center and must sign legally-binding confidentiality agreements before work begins. DRC will retain these agreements for the duration of the contract. To prevent the unauthorized duplication of secured materials, cell phone/camera use within the scoring rooms is strictly forbidden. Readers only have access to student responses they are qualified to score. Each scorer is assigned a unique username and password to access DRC's imaging system and must qualify before viewing any live student responses. DRC maintains full control of who may access the system and which item each scorer may score. No demographic data is available to scorers at any time.

Scorers will be divided by content area or course as detailed in the previous table. Depending on the overall progress of the project, more scorers may be added to some groups. Additionally, depending on the overall progress of the project, some groups may subdivide and work on different items.

## Scorer Degree Requirements

DRC readers scoring for Louisiana have at least a four-year college degree. DRC has a Human Resources Director dedicated solely to recruiting and retaining our handscoring staff. In the screening process, preference is given to candidates with previous experience scoring large-scale assessments and with degrees emphasizing the appropriate content areas. During personal interviews, reader candidates are asked to demonstrate their own proficiency in writing by responding to a DRC writing topic and in mathematics by solving word problems with correct work shown. All of this results in a highly educated and diverse workforce. Our personnel files for readers and Team Leaders include evaluations for each project completed. We use these evaluations to place individuals on projects that best fit their professional backgrounds, their college degrees, and their performance on similar projects at DRC.

Page 2

## Training

In preparation for the scoring of all LEAP 2025 and EOC items, DRC scoring supervisors will train readers using the same training materials that were used by previous vendors for prior administrations of the same items. These training materials originated from the sources noted below.

Reader training materials for the following were provided to DRC by Pacific Metrics and previously approved by LDOE:

- EOC Biology and English III

Reader training materials for the following were developed by DRC in conjunction with LDOE:

- LEAP 2025 grades 3-8 Science and Social Studies, as well as select items for grades 3-8 Math (noted as DRC Material Type on pages 14-15) originating with the spring 2018 DRC field test
- LEAP 2025 Biology and U.S. History, as well as select items for Algebra I and Geometry (noted as DRC Material Type on pages 12-13) originating with the spring 2018 DRC field test

Reader training materials for the following were provided to DRC by New Meridian and were approved by the Partnership for Assessment of Readiness for College and Careers (PARCC):

- LEAP 2025 grades 3-8 ELA and Math items developed by PARCC
- LEAP 2025 Algebra I, Geometry, English I, and English II items developed by PARCC

The materials include:

- Passages, items/prompts, associated stimuli for applicable content areas/courses and item types;
- Rubrics;
- Anchor Sets;
- Training Sets (or Practice Sets); and
- Qualifying Sets.

DRC will start the training with a review of passages, items/prompts, rubrics, and anchor responses, followed by the scoring and discussion of Training/Practice Sets and the scoring and discussion of Qualifying Sets. Once this process has been completed for an item or prompt, qualified readers will be able to start scoring live student responses. A group of scorers will score responses for a particular item until the scoring for that item is complete. Then they may move on to score a different item. Depending on the overall progress of the project and the current quantity of responses available to score for each item, some groups may subdivide and work on different items. Additionally, depending on the overall progress of the project, more scorers may be added to some groups when the groups are ready to score new items.

The following tables detail the composition of the training materials for all of the spring 2019 administration of the LEAP 2025 grades 3-8 and high school and EOC assessments.

## Training Materials

## EOC Biology, LEAP 2025 Biology, LEAP 205 U.S. History, and LEAP 2025 Grades 3-8 Science and

 Social StudiesReader training for the EOC biology task is conducted using item-specific anchor sets, training sets, and qualifying sets provided by Pacific Metrics. The LEAP 2025 biology, U.S. history, and grades 3-8 science and social studies item-specific training materials were developed by DRC.

| Set Type* | Biology, U.S. History, and Grades 3-8 Science and Social Studies Training <br> Materials | Annotated |
| :--- | :--- | :--- |
| Anchor Set | Most item-specific anchor sets contain at least two responses per score <br> point (with at least one example of each of the top scores).* | Yes |
| Training Sets | There are at least two training sets for each item <br> $\bullet \quad 10$ responses per training set <br> $\bullet \quad$ All numeric score points are represented* | No |
| Qualifying Sets | There are two qualifying sets for each item <br> $\bullet \quad 10 ~ r e s p o n s e s ~ p e r ~ q u a l i f y i n g ~ s e t ~$ |  |
| $\bullet \quad$ All numeric score points are represented* |  |  |

## EOC English III

For English III, the Content and Style dimensions will be trained using prompt-specific scoring guides, training sets, and qualifying sets provided by Pacific Metrics.

| Set Type | Content and Style Dimension Training Materials | Annotated |
| :--- | :--- | :--- |
| Content and Style <br> Anchor Set* | 20 responses representing all numeric score points and including <br> nonscore condition codes | Yes |
| Content and Style <br> Training Sets 1-3 | 30 responses across the three training sets <br> All numeric score points are represented in each set. <br> Readers will score each response for both Content and Style. | No |
| Content and Style <br> Qualifying Sets 1-3 | 40 responses across the three qualifying sets <br> All numeric score points are represented in each set. <br> Readers will score each response for both Content and Style. | No |
| * Some responses appear more than once in the Anchor Set to illustrate both a Content and a Style score. |  |  |

Page 4

EOC English III training materials covering the four elements of the Conventions dimension (Sentence Formation [F], Usage [U], Mechanics [M], and Spelling [S]) are made up of sets that include examples from multiple writing prompts. Roughly half of the responses in each set are a score point 0 for each element and a score point 1 for each element.

| Set Type | Conventions (F, U, M, S) Element Training Materials | Annotated |
| :--- | :--- | :--- |
| Conventions <br> Anchor Set* | 6 responses for each Conventions element representing both <br> numeric score points (three Os and three 1s for each of the four <br> elements) | Yes |
| Conventions <br> Training Sets 1-2 | 20 responses across both training sets <br> Both numeric score points are represented in each set. <br> Readers will score each response for all four elements. | No |
| Conventions <br> Qualifying Sets 1-2 | 20 responses across both training sets <br> Both numeric score points are represented in each set. <br> Readers will score each response for all four elements. | No |
| *Some responses appear more than once in the Conventions Anchor Set to illustrate scores in more than one <br> element. |  |  |

## LEAP 2025 Algebra I, Geometry, and Grades 3-8 Math (Items and Materials Developed by DRC)

Training materials for math items developed by DRC and field tested in spring of 2018 are made up of item-specific anchor sets, training sets, and qualifying sets developed by DRC.

| Set Type* | Algebra I, Geometry, and Grades 3-8 Math Training Materials | Annotated |
| :--- | :--- | :--- |
| Anchor Set | Each item-specific anchor set contains at least two responses per score <br> point (with at least one of each of the top score points). | Yes |
| Training Sets | There are two training sets for each item representing the range of <br> responses <br> $\bullet \quad 10 ~ r e s p o n s e s ~ p e r ~ t r a i n i n g ~ s e t ~$ | No |
| Qualifying Sets | There all numeric score points are represented* <br> $\bullet \quad 10$ responses per qualifying set |  |
| *Examples of responses at the top score points may not be present in some anchor, training, and qualifying sets as <br> there may have been few or no examples found during rangefinding or subsequent field test scoring. In such cases, <br> DRC Scoring Directors will identify examples of these scores during live scoring to supplement reader training. |  |  |

Page 5

LEAP 2025 Algebra I, Geometry, English I, English II, and Grades 3-8 ELA and Math (Items and Materials Developed by PARCC)
For all LEAP 2025 English I, English II, and grades 3-8 ELA items and a portion of the LEAP 2025 Algebra I, Geometry, and grades 3-8 math items (exceptions are referred to on page 5 in the LEAP 2025 Algebra I, Geometry, and grades 3-8 Math [Items Developed by DRC] section and specifically noted on pages 1115), DRC will use the PARCC-approved training and qualifying materials provided by New Meridian. Training materials for each item can be grouped into one of two categories: "prototype" item materials or "abbreviated" item materials.

## Prototype Item Materials

Some PARCC items included in the Louisiana forms are prototype items, meaning they have full sets of associated training materials, including Anchor Sets, Practice Sets, and Qualifying Sets. DRC will start the training with a review of passages/items, rubrics, and anchor responses, followed by the scoring and discussion of Practice Sets and the scoring and discussion of Qualifying Sets. Once this process has been completed for a prototype item included on the Louisiana form, qualified readers will start scoring live student responses for that item.

## Abbreviated Item Materials

Unlike prototype items, abbreviated PARCC item training materials have only two item-specific Practice Sets and no Qualifying Sets; therefore, abbreviated items require a two-step training/qualifying process. First, scorers will train and qualify as described in the Prototype Item Materials section above using PARCC-approved training materials for an associated prototype item that is similar to the abbreviated one they will be scoring on the Louisiana form. ${ }^{1}$ Readers who do not qualify on the prototype item will not be allowed to continue the training.

After qualifying on the associated prototype item, readers receive additional item-specific training on the abbreviated item they are going to score. This consists of an item-specific Anchor Set and two itemspecific Practice Sets. After completing the abbreviated item's training, readers may begin scoring live responses for the abbreviated item.
${ }^{1}$ Item associations were determined by PARCC and Pearson with the understanding that aspects of training are generalizable across similar items. For mathematics, the determination of prototype versus abbreviated items was made by PARCC and Pearson based on similar item types and by evidence statements. For ELA items, this determination by PARCC and Pearson was based on grade/course and task type.

Page 6

The following tables detail the composition of the training materials provided by New Meridian for math and ELA:

Algebra I, Geometry, and Grades 3-8 Math Training Set Composition

| Set Type | Mathematics Prototype Item <br> Training | Mathematics Abbreviated Item <br> Training | Annotated |
| :--- | :--- | :--- | :--- |
| Anchor Set | 3 responses per score point (Composite <br> items will have 3 responses per <br> composite score) | 3 responses per score point (Composite <br> items will have 3 responses per <br> composite score) | Yes |
| Practice <br> Set 1 | 10 responses representing the range of <br> responses | 10 responses representing the range of <br> responses | Yes |
| Practice <br> Set 2 | 10 responses representing the range of <br> responses | 10 responses representing the range of <br> responses | Yes |
| Qualifying <br> Set 1 | 10 responses comparable to the anchor <br> set responses |  | No |
| Qualifying <br> Set 2 | 10 responses comparable to the anchor <br> set responses |  | No |
| Qualifying <br> Set 3 | 10 responses comparable to the anchor <br> set responses |  | No |

English I, English II, and Grades 3-8 ELA Training Set Composition
$\left.\begin{array}{|l|l|l|l|}\hline \text { Set Type } & \text { English Prototype Item Training } & \text { English Abbreviated Item Training** } & \text { Annotated } \\ \hline \begin{array}{l}\text { Anchor Set } \\ \text { (for the } \\ \text { RCWE and } \\ \text { WE traits) }\end{array} & \begin{array}{l}\text { 3 responses per score point } \\ \text { Anchor Sets for prototype RST and LAT } \\ \text { item training include scores for the } \\ \text { combined trait Reading Comprehension } \\ \text { and Written Expression (RCWE). } \\ \text { Anchor sets for prototype NWT item } \\ \text { training include scores for Written } \\ \text { Expression (WE). }\end{array} & \begin{array}{l}\text { 3 responses per score point } \\ \text { Anchor Sets for abbreviated RST and } \\ \text { LAT item training include scores for } \\ \text { the combined trait Reading } \\ \text { Comprehension and Written } \\ \text { Expression (RCWE). } \\ \text { Anchor Sets for abbreviated NWT } \\ \text { item training include scores for } \\ \text { Written Expression (WE). }\end{array} & \text { Yes }\end{array}\right\}$
*The PARCC-approved Direct Copy sets provide additional annotated sample responses that explain the scoring rationale for responses composed entirely or partially of text copied from the source passage(s) associated with an item. DRC scoring supervisors review these item-specific sets with the readers prior to scoring the associated item.
**Some English abbreviated item training sets approved by PARCC were for items that have previously been field tested only. The abbreviated (FT) training materials that were provided to DRC for these ELA CRs consist of a full-length anchor set with some annotations and a five-response practice set (unannotated). The full range of score points may not be represented in some anchor sets or practice sets.

| Set Type | English Prototype and Abbreviated Item Training | Annotated |
| :---: | :---: | :---: |
| Anchor Set (for the Knowledge of Language and Conventions trait) | - There are 3 responses per score point in each set. <br> - There are two mixed-prompt Anchor Sets per grade level (one set for NWT item training, another set for LAT/RST item training). These sets are not exclusive to specific prototype or abbreviated items; they are intended to familiarize readers with the conventions features appropriate to each task type. <br> - Subsequent Practice Sets for prototype and abbreviated items will require readers to practice scoring the Knowledge of Language and Conventions trait along with the RCWE trait (for LAT or RST) or with the WE trait (for NWT). <br> - In addition, readers will be required to qualify on the Knowledge of Language and Conventions trait during each prototype item qualifying session. | Yes |

Some items selected for use on the spring 2019 administration were previously only field tested by PARCC. Consequently, the abbreviated training materials available for use with these items are abridged versions of typical abbreviated sets of materials. They consist of:

- Anchor Set (for ELA, some have annotations and some lack examples of the top scores)
- One Practice Set of 5 responses (scored but unannotated in the case of ELA)
- Approximately 10 validity responses

Since these materials are somewhat limited compared to typical abbreviated materials, DRC will bolster the training by using the PARCC-approved field test validity responses provided by New Meridian as additional practice responses. DRC Scoring Directors will then pull additional validity responses from operational Louisiana responses to use during the scoring window. The Scoring Directors will also find examples of higher-scoring responses that might be missing from the field test anchors. The validity and additional exemplar responses, along with the DRC Scoring Directors' notes for all papers used during the training of the abbreviated (FT) items, will be submitted to LDOE for approval.

While the field test-only abbreviated item materials are somewhat limited compared to regular abbreviated materials (the main difference being a lack of formal written annotations and fewer practice responses), using the PARCC-approved validity responses provided by New Meridian as additional practice responses is intended to help fill that gap. It is important to note that readers still must qualify via standard qualification procedures on the prototype items for all items by first going through full training with the appropriate prototype Anchor Set, Practice Sets 1-4, and Qualifying Sets 13 (as well as the Conventions sets).

English I Constructed Response (CR) Items and Associated Training Materials

| Question | Form | Task | DRC Item ID | PARCC UIN | Material Type | Associated <br> Prototype Item* |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | D | LAT | 902152 | VH017536_2T | Abbreviated | VH037763_2T |
| 20 | D | RST | 914552 | GG431834057 | Abbreviated | VH017542 2T |
| 9 | E | RST | 914552 | GG431834057 | Abbreviated | VH017542 2T |
| 14 | E | NWT | 983215 | GG604245591 | Abbreviated (FT) | 6139 |
| 9 | A (SR) | RST | 902161 | VH017542_2T | Prototype | N/A |
| 14 | A (SR) | NWT | 906152 | VH084830 | Abbreviated | 6139 |
| 9 | C (AE) | RST | 902194 | VH017614_2T | Abbreviated | VH017542 2T |
| 14 | C (AE) | NWT | 902203 | 6139 | Prototype | N/A |

*An item ID listed in the Associated Prototype column indicates that readers must be qualified on that prototype prior to reviewing the Abbreviated training materials described in the cells to the left.

Abbreviated (FT) - Item has previously only been field tested by Pearson/PARCC. Abbreviated (FT) training materials for ELA consist of a full-length anchor set with some annotations and a five-response practice set (unannotated).

English II Prose Constructed Response (CR) Items and Associated Training Materials

| Question | Form | Task | DRC Item ID | PARCC UIN | Material Type | Associated <br> Prototype Item* |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | D | LAT | 906197 | HH428127697 | Abbreviated | 7233 2T |
| 20 | D | RST | 983688 | HH607742252 | Abbreviated | 7121 2T |
| 9 | E | RST | 983688 | HH607742252 | Abbreviated | 7121 2T |
| 14 | E | NWT | 983642 | HH432845949 | Abbreviated | VF908613 |
| 9 | A (SR) | RST | 902331 | VH004490 | Abbreviated | 7121_2T |
| 14 | A (SR) | NWT | 902354 | 7064 | Abbreviated | VF908613 |
| 7 | C (AE) | LAT | 906181 | HH431436431 | Abbreviated | 7233 2T |
| 20 | C (AE) | RST | 906190 | HH433954866 | Abbreviated | 7121 2T |

*An item ID listed in the Associated Prototype column indicates that readers must be qualified on that prototype prior to reviewing the Abbreviated training materials described in the cells to the left.

Grades 3-8 ELA CR Items and Associated Training Materials

| 8 | 7 | LAT | 913958 | F1460 | Abbreviated | 5271 |
|  | 20 | RST | 982327 | FF506834510 | Abbreviated (FT) | VH007336 |

*An item ID listed in the Associated Prototype column indicates that readers must be qualified on that prototype prior to reviewing the Abbreviated training materials described in the cells to the left.
Abbreviated (FT) - Item has previously only been field tested by Pearson/PARCC. Abbreviated (FT) training materials for ELA consist of a full-length anchor set with some annotations and a five-response practice set (unannotated).

| 46 | 914381 | M25425 | Abbreviated | M21063 |
| 48 | 899329 | N/A | DRC | N/A |

*An item ID listed in the Associated Prototype column indicates that readers must be qualified on that prototype prior to reviewing the Abbreviated training materials described in the cells to the left.
Abbreviated (FT) Material Type - Item has previously only been field tested by Pearson/PARCC. Abbreviated (FT) training materials consist of a full-length Anchor Set and a five response Practice Set (both are annotated).
DRC Material Type - Training materials built by DRC using 2018 field test responses. These materials consist of an annotated Anchor Set, two Practice Sets, and three Qualifying Sets specific to each CR.

## Qualifying

Scorers must demonstrate their ability to apply the scoring criteria by qualifying (i.e., scoring with acceptable agreement with true scores on qualifying sets). After each qualifying set has been scored, the DRC Scoring Director responsible for training the item will lead the scorers in a discussion of the set.

Any scorer who does not qualify by the end of the qualifying process for an item will not be allowed to score actual student work for that item.

In order to maintain scoring comparability with prior administrations of the same items, DRC will use the same qualifying standards for the spring 2019 administration of the LEAP 2025 and EOC items as were established by the vendors who scored these items previously. Qualifying standards for LEAP 2025 biology and grades 3-8 science were approved by the LDOE in February 2019.

## EOC Biology and EOC English III

Descriptions of the qualifying standards for the EOC Biology and EOC English III item types are below. These standards were established by Pacific Metrics.

EOC Biology

| Course | Qualifying Standard |
| :--- | :--- |
| EOC Biology | Scorers must qualify with 80\% exact agreement or higher on one or more of the qualifying <br> sets in order to score student responses. |

## EOC English III

| Course | Qualifying Standard |
| :--- | :--- |
| EOC English III <br> (Content and <br> Style) | EOC English III scorers will first qualify on the Content and Style dimensions before moving <br> on to qualify in the Conventions dimension. Each reader will complete at least two <br> qualifying sets, and a score of 70\% exact agreement or higher is required in each <br> dimension in order to qualify. Since readers complete two sets, they may qualify on one <br> dimension in the first set and the other dimension in the second set. |
| EOC English IIII <br> (Conventions) | Once qualified for Content and Style, readers must then qualify for each of the four <br> elements (F, U, M, and S) that make up the Conventions dimension. An exact agreement <br> rate of 80\% or higher is required once on each of the individual Conventions elements. A <br> scorer may qualify on some elements in the first qualifying set and the remaining elements <br> in the second qualifying set. |

## LEAP 2025 Constructed-Response and Extended-Response Items

For all LEAP 2025 ELA and math CR items, DRC will follow the same qualification standards followed by Pearson for PARCC. A description of these qualifying standards is below.

## LEAP 2025 English I, English II, and Grades 3-8 ELA

| Course | Qualifying Standard |  |
| :--- | :--- | :--- |
| English I, | Perfect Agreement | Perfect Plus Adjacent Agreement |
| English II, <br> and <br> Grades 3-8 <br> ELA | $70 \%$ average for both traits on two of three <br> qualifying sets | $96 \%$ across the three qualifying sets <br> combined on both traits |
|  | $70 \%$ on each trait at least once across three <br> qualifying sets |  |

Readers of English I, English II, and grades 3-8 ELA responses are required to meet all three of the qualifications listed in the table. Perfect Plus Adjacent Agreement of $96 \%$ means that out of the entire pool of scores that a reader gives across the three qualifying sets for an item, no more than $4 \%$ of those scores can be non-adjacent. In other words, no more than 2 of the 60 applied scores can be nonadjacent ( 3 sets $\times 10$ responses/set $\times 2$ traits $=60$ applied scores).

## LEAP 2025 Algebra I, Geometry, and Grades 3-8 Math

| Course | Qualifying Standard |  |  |
| :--- | :--- | :--- | :--- |
| Algebra I, <br> Geometry, <br> and Grades <br> 3-8 Math | Comprehensive | Perfect Agreement | Perfect Plus Adjacent Agreement |
|  | $0,1,2,3,4$ Rubric | $70 \%$ on two of three sets | $96 \%$ on two of three sets |
|  |  | $70 \%$ on two of three sets | $95 \%$ on two of three sets |

| Course | Qualifying Standard |  |  |
| :---: | :---: | :---: | :---: |
| Algebra I, Geometry, and Grades 3-8 Math | Composite (multipart) Items* | Perfect Agreement | Perfect Plus Adjacent Agreement |
|  | 0,1 Rubric | 90\% on two of three sets | 100\% on two of three sets |
|  | 0, 1, 2 Rubric | 80\% on two of three sets | 96\% on two of three sets |
|  | 0, 1, 2, 3 Rubric | 70\% on two of three sets | 96\% on two of three sets |
|  | 0, 1, 2, 3, 4 Rubric | 70\% on two of three sets | 95\% on two of three sets |

*For mathematics composite items, the appropriate qualifying standard should be achieved on each part of the item. For example, if an item has Part A with a top score of 1, Part B with a top score of 2, and Part C with a top score of 3 , a scorer/supervisor would need to achieve $90 \%$ perfect agreement on Part A, $80 \%$ perfect agreement on Part B, and $70 \%$ perfect agreement on Part C, with no more than one nonadjacent score per part across all three qualifying sets.

LEAP 2025 U.S. History and Grades 3-8 Social Studies

| Course and Item Type | Qualifying Standard |
| :--- | :--- |
| U.S. History and <br> Grades 3-8 Social Studies <br> 0-2 point CRs | Scorers must qualify with 80\% exact agreement or higher on one or more of <br> the qualifying sets in order to score student responses. |
| U.S. History and <br> Grades 5-8 Social Studies <br> 0-8 point, 2-dimension ERs <br> (Content, 0-4; Claims, 0-4) | Scorers must qualify with 70\% exact agreement or higher in both the Content <br> trait and the Claims trait on one or more of the qualifying sets in order to <br> score student responses. Since scorers complete two sets, they may qualify on <br> one trait in the first set and the other trait in the second set. |

LEAP 2025 Biology and Grades 3-8 Science

| Course and Item Type | Qualifying Standard |  |
| :---: | :---: | :---: |
| Biology and Grades 3-8 Science 0-2 point CRs | 0-2 Rubric | Scorers must qualify with $80 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
| Biology and Grades 3-8 Science <br> Composite (multi-part) ER items* | 0-1 Rubric | Scorers must qualify with $90 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-2 Rubric | Scorers must qualify with $80 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-3 Rubric | Scorers must qualify with 70\% exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-4 Rubric | Scorers must qualify with 70\% exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-5 Rubric | Scorers must qualify with 70\% exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-6 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-7 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-8 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
| Grades 3 and 4 Science Comprehensive (single part) ER items | 0-6 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
| Biology and Grades 5-8 Science Comprehensive (single part) ER items | 0-9 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |

*Qualifying Sets are made up of 10 responses comparable to the Anchor Set responses. For multi-part (composite) Biology and Grades 3-8 Science ERs, the appropriate qualifying standard should be achieved on each part of the item. For example, if an item has Part A with a top score of 6 and Part B with a top score of 3, a scorer would need to achieve 60\% perfect agreement on Part A and $70 \%$ perfect agreement on Part B on one or more of the qualifying sets. A scorer may qualify on one part in the first qualifying set and the other part in the second qualifying set.

## Spring 2019 Scoring Plan

The charts below provide an overview of the Spring 2019 LEAP 2025 and EOC scoring plan, detailing the types of scoring that will be done for each course/grade.

## LEAP 2025 High School and EOC

| Course | Handscoring Only | Al Scoring | Al Vendor |
| :---: | :---: | :---: | :---: |
| LEAP 2025 English I | NWT_GG604245591 (Form E) <br> RST_VH017614_2T (Form C - AE) <br> NWT_6139 (Form C - AE) <br> RST_VH017542_2T (Form A - SR) <br> NWT_VH084830 (Form A -SR) | $\begin{aligned} & \hline \text { LAT_VH017536_2T (Form D) } \\ & \text { RST_GG431834057 (Forms D \& E) } \end{aligned}$ | Pearson |
| LEAP 2025 English II | RST_HH607742252 (Forms D \& E) <br> LAT_HH431436431 (Form C - AE) <br> RST_HH433954866 (Form C - AE) <br> NWT_7064 (Form A - SR) <br> RST_VH004490 (Form A - SR) | LAT_HH428127697 (Form D) NWT_HH432845949 (Form E) | Pearson |
| EOC English III | Writing Prompt (Form X - AE ) | Writing Prompt (Form W) | Measurement Inc. |
| LEAP 2025 Algebra I | All CRs | N/A |  |
| LEAP 2025 Geometry | All CRs | N/A |  |
| LEAP 2025 Biology | All CRs and ERs | N/A |  |
| EOC Biology | ERs (operational and AE form) | N/A |  |
| LEAP 2025 U.S. History | All CRs, ER (AE form) | ER (operational) | Measurement Inc. |

Note: All Administrative Error [AE] form items are handscored by DRC scoring supervisors.

## LEAP 2025 Grades 3-8

| Course | Handscoring Only | Al Scoring* | Al Vendor |
| :--- | :--- | :--- | :--- |
| ELA grade 3 | Both CRs | N/A |  |
| ELA grade 4 | Both CRs | N/A |  |
| ELA grade 5 | Both CRs | N/A |  |
| ELA grade 6 | N/A | Both CRs | Pearson |
| ELA grade 7 | RST_E1567 | NWT_EE430133306 | Pearson |
| ELA grade 8 | RST_FF506834510 | LAT_F1460 | Pearson |
| Math grades 3-8 | All CRs | N/A |  |
| Science grades 3-8 | All CRs and ERs | N/A |  |
| Social Studies grades 3 and 4 | All CRs | N/A |  |
| Social Studies grades 5-8 | All CRs | All ERs | Measurement Inc. |
| *DRC's handscoring teams will provide a second read for at least ten percent of all Al-scored responses. |  |  |  |

## Handscoring Rules

## Al Scoring

For EOC English III and the LEAP 2025 U.S. History and grades 5-8 Social Studies ER items, Measurement Incorporated's (MI) Project Essay Grade (PEG) AI scoring system will provide the first score (the score of record). For select CRs in LEAP 2025 English I, English II, and grades 6-8 ELA (see Spring 2019 Scoring Plan on page 19), Pearson's Intelligent Essay Assessor (IEA) will provide the first score (the score of record). DRC's handscoring teams will provide a second read for at least ten percent of these responses in order to capture the inter-rater reliability statistics that will be used to manage scoring consistency of both the Al scoring systems and the handscoring teams. Scoring Directors will also review nonscores, alerts, and flagged responses as required. (For additional information about the nonscore, alert, and flagged response review process, please see the Handling Unusual Responses section starting on page 26.) The Al scoring process is discussed in-depth later in this document.

## Handscoring

All scores for handscored items (noted as Handscoring Only in the Spring 2019 Scoring Plan) will be provided by DRC's handscoring team. The first score will be the score of record. Ten percent of the responses will be scored twice to monitor and maintain inter-rater reliability. Scoring Directors will review all nonscores and alerts.

In addition, per PARCC/Pearson rules for ELA and math, if the first two scores are nonadjacent (e.g., 0, 2), a third, independent reading by a Team Leader or Scoring Director will be conducted for additional quality control monitoring. In the unlikely event that a response receives three nonadjacent scores (i.e., $0,2,4)$, a Scoring Director or Project Manager will review the response and provide retraining as needed.

Calculating the Final Score:

- The score associated with the first scorer is always the score of record, regardless of how many subsequent scores are applied.
- After handscoring, when the final score-processing for the ELA items takes place, the Written Expression trait score is multiplied by 3 (for the Narrative Writing Task). The Reading Comprehension and Written Expression (RCWE) trait score is multiplied by 4 (for the Literary Analysis and Research Simulation tasks), and one fourth of this weighted score will be assigned as the Reading Comprehension score, and three fourths of this weighted score will be assigned as the Written Expression score. The Knowledge of Language and Conventions score is not weighted. (For more information, please see the Scoring Rules found in the '/Scoring Documentation' folder posted on the Reporting SFTP site.)

## Reader Monitoring Procedures

## Team Leader Read-Behinds

Throughout the handscoring process, DRC Project Managers, Scoring Directors, and Team Leaders will review the statistics that are generated on a daily basis. DRC will assign one Team Leader for every 1012 readers. (When test numbers are low and smaller groups of 10 or fewer readers are used, these groups may be supervised directly by the Scoring Director.) If scoring patterns are apparent among individual scorers, Team Leaders or Scoring Directors will handle these issues on an individual basis. If a scorer appears to need clarification of the scoring rules, DRC supervisors typically monitor one out of five of the scorer's readings, making adjustments to that ratio as needed. If a supervisor disagrees with a reader's scores during monitoring, he or she will correct the score and provide retraining in the form of direct feedback to the reader, using rubric language and applicable training responses. The supervisor's corrected score becomes the score of record; it is not a second read.

DRC will also monitor the inter-rater reliability, which is to be based on the $10 \%$ of responses that receive second reads. If a scorer falls below the expected rate of agreement, the Team Leader or Scoring Director will retrain the scorer. If a scorer fails to improve after retraining and feedback, DRC will remove the scorer from the project. In this situation, DRC will remove all unreported scores that were assigned by the scorer during the period in question. These unreported responses with dropped scores will then be re-dealt and rescored.

## Validity Sets and Inter-Rater Reliability

In addition to the feedback that supervisors provide to readers based on regular read-behinds and the continuous monitoring of inter-rater reliability and score point distributions, DRC will also conduct validity scoring. For LEAP 2025 Algebra I, Geometry, English I, and English II, and grades 3-8 Math and ELA items from New Meridian, DRC will utilize the same validity responses that Pearson used. These validity responses were approved by PARCC and supplied by New Meridian.

DRC scoring supervisors will identify validity responses during live scoring for all newly operational LEAP 2025 items in Algebra I, Geometry, Biology, U.S. History, and grades 3-8 Math, Science, and Social Studies. DRC will post these validity responses and their scores to the secure LDOE SFTP site for LDOE content staff to review and approve. Validity responses previously identified and approved for EOC Biology and EOC English III will be reused.

The validity responses will be added to DRC's image handscoring system prior to the beginning of scoring (with the exception of the previously noted LEAP 2025 validity responses, which will be identified and added during live scoring). The distribution of validity responses will be more frequent at the beginning of the scoring window and will decrease as agreement levels reveal a strong understanding and application of the scoring guidelines by the scorers. Validity reports compare scorers' scores to pre-determined scores and can help detect potential room drift as well as individual scorer drift. This data will be used to make decisions regarding the retraining and/or release of scorers, as well as the rescoring of responses.

Page 21

To monitor inter-rater reliability, DRC will produce handscoring quality control reports on a daily basis (see the sample on page 25) that provide exact, adjacent, and nonadjacent agreement rates for each reader and item on a daily and cumulative basis. These rates are calculated based on responses that are scored by two readers (or PEG or IEA-the AI scoring systems-and one reader). MI's PEG AI scoring system will provide the first scores (the scores of record) for EOC English III and the LEAP 2025 U.S. History and grades 5-8 Social Studies ERs. For LEAP 2025 English I and English II, and select CRs in grades 5-8 ELA (see Spring 2019 Scoring Plan), Pearson's IEA will provide the first score (the score of record). This data will be used in conjunction with scores from human-conducted second reads to calculate inter-rater reliability statistics in these content areas. Metrics and standards associated with the two Al scoring systems and their processes are described in the AI Scoring section starting on page 28. Al scores will be attributed to reader ID number 3 in the appropriate scoring reports. The calculations on these reports are:

- Percent Exact (\%EX)-total number of responses by reader where scores are the same, divided by the number of responses that were scored twice.
- Percent Adjacent (\%AD)-total number of responses by reader where scores are one point apart, divided by the number of responses that were scored twice.
- Percent Non-Adjacent (\%NA)-total number of responses by reader where scores are more than one score point apart, divided by the number of responses that were scored twice.

DRC will strive to maintain the inter-rater and validity exact agreement rates at or above the percentages noted below. When a reader's validity or inter-rater agreement falls $5 \%$ or more below these expectations, or if Perfect Agreement + Adjacent percentages fall below the rates noted, the reader will be flagged for additional monitoring and/or retraining by their Team Leader or Scoring Director. Additionally, for all items which will be Al scored, low inter-rater reliability will be investigated to see if it is an indication that the handscorers need retraining or if the AI needs retraining (see the AI Scoring section for details about Al training).

The validity and inter-rater reliability expectations for EOC and LEAP 2025 items are shown below.

| Agreement Rate Expectations for Validity and Inter-Rater Reliability LEAP 2025 and EOC |  |  |  |
| :---: | :---: | :---: | :---: |
| Content Area/Course | Score Point Range | Perfect <br> Agreement | Perfect <br> Agreement + <br> Adjacent |
| Grades 3-8 ELA, English I, English II | 0-3 or 0-4 Rubric, Multi-trait | 65\% (each trait) | 96\% (each trait) |
| EOC English III (Style and Content) | 1-4 (each domain) | 70\% | 95\% |
| EOC English III $(F, U, M, S)$ | 0-1 (each domain) | 80\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-1 Rubric | 90\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-2 Rubric | 80\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-3 Rubric | 70\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-4 Rubric | 65\% | 95\% |
| EOC Biology | 0-4 Rubric | 80\% | 95\% |
| LEAP 2025 Biology and Grades 3-8 Science CR items | 0-2 Rubric | 80\% | 95\% |
|  | 0-1 Rubric | 90\% | 100\% |
|  | 0-2 Rubric | 80\% | 95\% |
|  | 0-3 Rubric | 70\% | 95\% |
| LEAP 2025 Biology and Grades 3-8 Science | 0-4 Rubric | 70\% | 95\% |
|  | 0-5 Rubric | 70\% | 95\% |
|  | 0-6 Rubric | 60\% | 93\% |
|  | 0-7 Rubric | 60\% | 93\% |
|  | 0-8 Rubric | 60\% | 90\% |
| LEAP 2025 Grades 3 and 4 Science <br> Comprehensive <br> (single part) ER items | 0-6 Rubric | 60\% | 93\% |
| LEAP 2025 Biology and Grades 5-8 Science Comprehensive (single part) ER items | 0-9 Rubric | 60\% | 90\% |
| LEAP 2025 U.S. History and Grades 3-8 Social Studies CR items | 0-2 | 80\% | 95\% |
| LEAP 2025 U.S. History and Grades 5-8 Social Studies 0-8 point, 2-dimension ER items (Content 0-4; Claims 0-4) | 0-4 (each trait) | 70\% | 95\% |

Page 23
4.26.19 | DRC Proprietary and Confidential

Each reader will be expected to maintain an acceptable level of exact agreement on validity responses and on inter-rater reliability as described above. Additionally, readers will be expected to maintain an acceptably low rate of nonadjacent agreement for validity and inter-rater agreement. To monitor this, we will sum each reader's percentages of exact and adjacent agreement rates and require each reader to maintain the levels displayed under "Perfect Agreement + Adjacent" in the tables on the previous page.

## Calibration Sets

Calibration sets are another means of ensuring consistency in scoring. DRC will use these sets to maintain calibration across the entire scorer population after breaks from scoring (e.g. weekends; down time between scoring periods; when moving between items/prompts). Calibration sets will also be used for an item if trends occur (e.g., low agreement between certain score points, if a certain type of response is missing from initial training).

The responses in these targeted sets help illustrate particular points and familiarize readers with the types of responses commonly seen during operational scoring. They are chosen by DRC scoring supervisors during live scoring or supplied by New Meridian (for Algebra I, Geometry, English I, English II, and grades 3-8 ELA and math). After the readers take one of these calibration sets (usually 5-10 responses), the Scoring Director will review the set from the front of the room using rubric language and the anchor responses to explain the reasoning behind each response's score. These sets do not have a passing requirement but are designed to help refocus readers on how to properly use the scoring guidelines to score responses. The Scoring Director or Team Leaders will provide individual feedback to any scorers in need of additional clarification based on their performance.

## Handscoring Quality Control Reports

Inter-rater Reliability
Score Point Distribution

Page 25

## Reader Feedback Logs

Reader performance and intervention information will be tracked and updated in bi-weekly Reader Feedback Logs. These Reader Feedback Logs provide at-a-glance information about retraining actions taken with individual readers to ensure scoring consistency in regard to reliability, score point distribution, and validity performance. The logs address the following possible actions:

- Action 1-Includes one or more of the following: increase monitor rate, show and discuss examples of errant scores, pair scorer with a supervisor or stronger reader, provide additional review or training materials/recalibration
- Action 2-Rescoring of responses for which scores have not been handed off for reporting
- Action 3-Removal from scoring item

Below is an example of a Reader Feedback log:

| Algebra I Q000 |  |  |  |  |  |  |  |  | M/D/Yr |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reader | \%EX Low | \%NA High | Score Point Distribution Skewed | Validity \%EX Low | Validity \%NA High | Comments | Action 1 | Action 2 | Action 3 |
| 3782 |  |  |  | - |  |  | $\bullet$ |  |  |
| 12860 |  |  | - |  |  |  | $\bullet$ |  |  |
| 13296 |  |  |  | $\bullet$ |  |  | $\bullet$ |  |  |
| 16070 | $\bullet$ |  |  |  |  |  | - |  |  |
| 18961 |  |  |  | $\bullet$ |  |  | $\bullet$ |  |  |

In addition to the Reader Feedback Logs, DRC will continue to provide the LDOE with handscoring quality control reports (the same cumulative scoring reports that we have provided in the past; samples are provided on page 25). The Scoring Summary reports show inter-rater reliability data and score point distribution information for each item (by part where appropriate).

## Handling Unusual Responses

## Nonscore Codes and Definitions

Handscored responses that cannot be assigned a score based on the rubric will be assigned a nonscore code. When readers apply nonscore codes, the responses are automatically routed to DRC handscoring supervisors for validation. Responses that receive a nonscore code count as zero points toward student scores that display on reports. The nonscore code will display in the response string that is included in the file provided to the LDOE.

If readers suspect plagiarism but have no concrete evidence, they score the response and alert it for suspected plagiarism. These responses are sent to supervisors for additional investigation. When supervisors find evidence of student-student plagiarism, each of the associated responses is scored according to rubric requirements and processed as an alert. Responses with proven student-internet plagiarism receive a score of 0 and are also processed as alerts. If supervisors cannot find definitive
proof of plagiarism in a response but suspect it to be likely, the response is scored using the rubric and processed as an alert. All responses with a possible plagiarism alert are sent to LDOE for final determination. (For additional information on final alert processing, see Alerts section below).

The non-score codes and the courses to which they apply are described below:
Nonscore Code Definitions

| Nonscore Code | Explanation |
| :---: | :--- |
| B | Blank/no response |
| F | Response is not written in English (Math responses from Spanish forms will <br> be scored by a Spanish-qualified math scorer.) |
| I | Response does not contain enough original writing to evaluate. There is an <br> insufficient amount of original writing to score and/or the response is <br> composed of copied text. (Insufficient also means copied text that may <br> have slight changes but does not introduce original ideas/thoughts.) |
| N | Don't understand/know |
| R | Refusal to respond |
| T | Off-topic |
| U | Incoherent, unintelligible, or undecipherable |

Nonscore Codes by Course

| Course | B | F | I | N | R | T | U |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LEAP 2025 Algebra I, English I, English II, <br> Geometry, 3-8 ELA, and 3-8 math | $\checkmark$ | $\checkmark$ | N/A | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| EOC English III | $\checkmark$ | $\checkmark$ | $\checkmark$ | N/A | N/A | N/A | $\checkmark$ |
| EOC Biology | $\checkmark$ | $\checkmark$ | N/A | N/A | $\checkmark$ | N/A | $\checkmark$ |
| LEAP 2025 Biology, 3-8 Science, U.S. History, and <br> 3-8 Social Studies ERs and CRs | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | N/A | $\checkmark$ |

## Alerts

Scorers have the ability to apply an alert flag to specific student responses. These are responses that may indicate the possibility of teacher interference, plagiarism, or disturbing content (e.g., possible physical or emotional abuse, suicidal ideation, threats of harm to themselves or others, etc.). After setting the alert flag, which states the reason for the alert, and providing a brief description (as necessary), the reader will score the response according to the specific scoring guidelines for that item.

Likewise, PEG and IEA have the ability to detect specific alerts (described in detail later in the Artificial Intelligence Scoring section of this document). All alerted responses (whether identified by a human reader or by AI) are automatically routed to the Scoring Director who reviews the score and forwards appropriate responses (including grade, content area/course, lithocode, item number, and reason for alert) to senior project staff and DRC's Project Management Team for review.

Page 27
4.26.19 | DRC Proprietary and Confidential

If it is concluded that a response warrants an alert, DRC Project Management will contact the LDOE with the student's LASID and post to the SFTP site the response information provided by the scoring staff for LDOE to review. If it is determined that a void is required due to plagiarism, the LDOE applies an invalidation to the record in eDIRECT. At no point during this process do scorers, Team Leaders, or Scoring Directors have access to demographic information for any students participating in the assessment. Note that the alert status of responses is not passed on in data files.

## Artificial Intelligence Scoring

As part of our comprehensive scoring solution, DRC uses two artificial intelligence (AI) scoring systems. Measurement Incorporated's (MI) Project Essay Grade (PEG) is used to score students' responses to the writing prompt for EOC English III and the extended-response items (ER) for LEAP 2025 U.S. History and grades 5-8 Social Studies. Pearson's Intelligent Essay Assessor (IEA) is used to score student responses to selected constructed-response (CR) items in grades 6-8 ELA, English I, and English II.

## Al Scoring - Measurement, Inc.

The items in the following table will be Al scored by MI during the Spring 2019 administration. Al scoring models were built for each of these items by MI in the fall of 2016 or fall of 2017 and followed the model-building process described below. (Model-building data for all items included on the spring 2019 test may be found in the Appendix.)

| Course | Item Type | IDEAS ID | Model Built |
| :--- | :--- | :--- | :--- |
| EOC English III | Writing <br> Prompt | 851370 | Fall 2016 |
| LEAP 2025 U.S. History | ER | 892955 | Fall 2017 |
| LEAP 2025 U.S. History | ER | 894104 | Fall 2017 |
| LEAP 2025 Grade 5 Social Studies | ER | $807773^{* *}$ | Fall 2016 |
| LEAP 2025 Grade 6 Social Studies | ER | $804889^{*}$ | Fall 2016 |
| LEAP 2025 Grade 7 Social Studies | ER | $805627^{*}$ | Fall 2016 |
| LEAP 2025 Grade 8 Social Studies | ER | $808905^{*}$ | Fall 2016 |

[^11]
## Model Building

For each model built, PEG analyzed a set of inputs that were randomly pulled from the training set itself, which is made up of approximately 2,500 examples of student field test responses scored by expert human scorers. Specifically, the training set was divided into two independent pieces:

- One set of response data was used to train the Al engine and produce the scoring model. This attributed to $85 \%$ of the training set ( $\sim 2,125$ responses).
- The remaining $15 \%$ of the training set ( $\sim 375$ responses) was then used to validate the resulting model.

A regression model was built by choosing a set of variables (e.g., grammar, punctuation, style, etc.) and using least squares Linear Regression to find a best-fit relationship based on the training set. An algorithm chose the initial set of variables and added to the set as needed to produce a good fit, by taking into account correlation statistics and multicollinearity. Once the model was built, it was then run against the validation set, so that it could be evaluated for accuracy. Training was complete once PEG's validation set scores agreed with the human scores; however, if this level of accuracy was not met, then further iterations of training (which may involve new parameterizations or new algorithms) were used to produce a different model with higher accuracy. This process was completed for each trait that needed to be scored.

To further understand the importance of the validation set, consider that one of the risks inherent in machine learning is over-fitting the data. This means that it is possible to home in on particular elements of the responses in training data in such a way that the model does not generalize well to unseen data. To mitigate this risk, PEG uses a hold-out validation strategy ${ }^{2}$ in which a randomly chosen subset of the initial training data is set aside, never used in training, but used only to evaluate the generalizability of models trained from the remainder of the set.

Validation is implicit in PEG's model training and, so, is complete for any model in production. The essential element of the process is that the models are trained on a larger subset of the training sample (approximately $85 \%$ ), then validated against an entirely separate smaller subset of the training sample (approximately 15\%). What is critical about this process and all validation schemes used in PEG training is that the AI's agreement is always based upon samples the AI has not encountered during training. Put another way, the samples used to train are never the same as the samples used to validate. This maximizes generalizability and minimizes the chance for over-fitting.

[^12]Page 29

## Evaluation Metric

When PEG builds a model, it selects the model elements that maximize scoring accuracy for the data in question. Therefore, it is important to choose an agreement statistic on which PEG can optimize its models in such a way that the final model will exhibit reliable, accurate scoring. The inter-rater reliability of two human raters is often measured via perfect/adjacent agreement or the Pearson product-moment correlation coefficient (Pearson's r). However, these two metrics each have significant disadvantages. Perfect/adjacent agreement is highly influenced by the overall scale and underlying distribution of the "true" scores (Williamson \& Breyer, 2012), while Pearson's $r$ is insensitive to mean difference between raters (Schuster, 2004).

MI has found that using quadratic weighted kappa, which has become the industry standard for Al scoring, as the optimization and evaluation metric leads to the most reliable and accurate scoring. Quadratic weighted kappa as a metric can detect changes in mean difference and variance between raters and is therefore well suited for comparing the accuracy of AI scoring with that of human scoring, as well as measuring the agreement of two independent human raters. For the sake of clarity in the discussion below, the quadratic weighted kappa between PEG and Reader 1 is referred to as $\kappa \omega$ (PEG, $R 1$ ) and quadratic weighted kappa between Reader 1 and Reader 2 is referred to as $\kappa \omega(R 1, R 2)$.

Even though quadratic weighted kappa performs well as an optimization metric, there are still some deficiencies in using it as an evaluation metric. Quadratic weighted kappa is far less influenced by the overall scale and underlying distribution of the "true" scores than perfect/adjacent agreement, but it does still display some sensitivity to those aspects of the data. In addition, while AI scoring can outperform human scoring with regard to scoring accuracy, the quality of the human scoring data has a significant impact on PEG's ability to accurately model the data. That is, a low $\kappa \omega(R 1, R 2)$ will usually lead to a low $\kappa \omega$ (PEG, R1). Because of these issues with sensitivity to scale and distribution of scores and being bound by the quality of the training data scores themselves, it is difficult to give a fixed number in all scales for what an acceptable value would be for $\kappa \omega$ (PEG, R1). In cases of four or more levels (e.g. a score ranging from 1-4, or broader) a $\kappa \omega($ PEG, R1) of 0.7 has become a rule of thumb as a go-no-go metric. In these broader scales, a $\mathrm{k} \mathrm{\omega}(\mathrm{PEG}, \mathrm{R} 1)$ that is less than 0.7 to any significant degree is typically grounds for rejecting the item for Al scoring. In cases where this metric is 0.7 or above, the performance is usually considered satisfactory for Al scoring; however, other metrics such as those discussed in the next paragraph are often considered for additional information.

For instance, where the score range is smaller, such as binary ( $0-1$ ) or ternary ( $0-2$ ) ranges, the QWK is of more limited use, as QWK subtracts the rate of chance agreement which is quite high in the binary and ternary cases. In binary and ternary cases, the percent-exact and percent-adjacent agreements can be valuable additional metrics as they are exhaustive in these extremely-limited-range cases. Also useful in such extreme cases is to compare the human-machine agreement with the human-human agreement. In these cases the difference between $\kappa \omega$ (PEG, R1) and $\kappa \omega($ R1, R2) can be used as an additional evaluation metric. MI defines that value as follows:

$$
\Delta \kappa=\kappa \omega(P E G, R 1)-\kappa \omega(R 1, R 2)
$$

When $\Delta \kappa$ is positive, PEG's scores are more in agreement with Reader 1 than Reader 1's scores are in agreement with Reader 2 . When $\Delta \kappa$ is negative, the opposite is true; Reader 1 and Reader 2 show higher agreement levels than PEG and Reader 1. Of course, in both cases the absolute value of $\Delta \kappa$ maintains its weight as a relative value between the two kappa values. That is, a larger $\Delta \kappa$ means more separation between the two kappa values being compared.

The first phase of training is to maximize agreement between the PEG (machine) score and the final expert human score. If high agreement can be reached in this phase (for instance, a quadratic weighted kappa of $\geq 0.7$ ), then the model is considered fit. The PEG team conducts secondary analysis such as this R1 vs. R2 analysis in cases where there is some question as to the fitness of the model - for instance, in a case in which PEG's quadratic weighted kappas are quite low, R1 vs. R2 analysis may be conducted to determine if the lack of agreement is a shortcoming of PEG's training, or if it is implicit in the data. This was not necessary in the current set, with the exception of the binary (i.e. zero-or-one) scores for some English traits. Analysis in this case showed not only that human-human quadratic weighted kappas in the training set were low, but, more to point, that random sets of such binary scoring showed similarly low quadratic weighted kappas. In this case, the low quadratic weighted kappa was simply an artifact of the definition of quadratic weighted kappa itself and no further R1 vs. R2 analysis was necessary.
$\Delta K$ is a good metric to quickly show how accurately PEG was able to score a set of data with respect to how accurate human raters are on the same data, but MI also reports other metrics that its clients may be more familiar with, such as perfect/adjacent agreement, Pearson's $r$, and standard mean difference. However, since PEG was optimized on quadratic weighted kappa, $\kappa \omega$ and $\Delta \kappa$ are the best reflections of actual performance.

## Scoring Responses with the Al Engine

The PEG AI scoring engine extracts and uses a large and proprietary set of linguistic feature metrics both during training and during production scoring. During training, PEG's models "learn" to represent the many complex and almost always non-linear relationships found between these linguistic features and the score points assigned by human experts. During production scoring, these same features are extracted from submitted responses. The previously trained models related to the item in question are then used to map these features to their predicted score points.

After PEG has been trained on a scored training set provided by DRC, it is available to receive batches of student responses in a mutually agreed upon format (XML or plain-text). The current preferred scoring method is to exchange XML documents via a web service. No static files are exchanged during this process. The web service supports discovery via Web Service Description Language (WSDL). The file transfer will be encrypted and will satisfy FERPA security requirements. Each record in the batch provides PEG with the student's response and a number of identifiers. The identifiers typically consist of a test ID that uniquely identifies the test, an item ID that uniquely identifies the prompt/item, and a FERPA-compliant student ID that uniquely identifies either the student or the student-test combination. The tables in Section 2 of the "DRC - Streaming Scoring" document (see Appendix) also contain information on identifiers.

Page 31

When PEG receives the file, it processes the batch of responses and records the scores. Each record is specific to a student-test-item combination and will contain the item's score or a reason why it could not be scored (most commonly because the response is too short, or does not contain English). After the batch is processed, the scored records will be returned to DRC for reporting.

DRC will send files to MI daily. Scored files will typically be returned to DRC in 2 to 3 days; however, these timeframes are not definite, because they are dependent on numerous variables involved (e.g. number of responses submitted, number of different items, number of traits per item, the average response length, the standard deviation of response lengths, number of unique words submitted in each response, etc.).

Regardless of whether responses are scored by humans or machines, it is inevitable that scoring anomalies requiring human intervention will occur. Built into MI's automated scoring engine are a variety of triggers for identifying alert papers and responses in which it has low confidence. This is detailed later under "Identifying Responses for Human Review."

## Quality Control of the AI Engine

The guidelines below are purposefully general as they have proven to be the best practice for training the PEG engine. The PEG team followed this standard procedure in the DRC/Louisiana project and attempted to maximize human-machine quadratic weighted kappa among all holdout sets.

PEG holds out a $15 \%$ set of training data for use in validation. This holdout set is not seen by the AI during training. Instead, once training is complete, the holdout set is submitted for test evaluation and PEG's output is compared to the known, human-expert scores. As discussed in "Evaluation Metric" above, the quadratic weighted kappa has proven to be the most valuable agreement metric in PEG's recent history; however, others (e.g., exact, adjacent, and any host of others) are also applicable.

This evaluation was performed along with model building prior to operational scoring, and the results were shared with LDOE and the TAC to demonstrate sufficient scoring accuracy by PEG. For details on these results, please see pages 51-53 in the Appendix.

Once training and model building is complete, the performance of any given model is essentially deterministic (so, for a precise, given input, the output is expected to be identical). The PEG team monitors the services for unexpected events (for instance physical damage to its cloud infrastructure), and handles any data flow issues (for instance, if the client was using a different item number during live scoring than was used during training) but the Al itself does not change during live scoring. When readbehind data becomes available to the PEG team (typically this is on an annual basis), it can be used to reevaluate and, if necessary, retrain the existing models prior to the next season of use, but such changes do not happen during live scoring. As part of our continuous improvement cycle, the analysis of this data is on-going with no current end date (i.e., items are being reviewed on a rolling basis).

## Identifying Responses for Human Review

Built into MI's automated scoring engine are a variety of triggers for identifying responses that require human review, including potential alerts (suspected plagiarism included) and potential nonscorable

Page 32
4.26.19 | DRC Proprietary and Confidential
responses (e.g., responses that are primarily copied text, lack proper development, lack enough content to be scored, or are written in an unsupported language). Many of these triggers have clientconfigurable thresholds. These can be set to standard defaults and then modified as needed. Thresholds are generally deliberately conservative. DRC will work with LDOE content staff and MI to look at the responses that PEG identifies for human review to make sure the high and low copied text and minimum word count settings are set appropriately. (See pages 35-36 for detailed information about these custom thresholds.)

Please note that all responses that are identified in the sections below for human review will be automatically forwarded to a DRC Scoring Director who will determine the correct score or nonscore code to apply to the response. The Scoring Director will provide the final, reported score (or nonscore) for these responses. If the Scoring Director needs assistance in determining the correct score or nonscore, DRC will work with LDOE content staff to ensure that the response is scored correctly.

## Alert Detection System

PEG has a robust system for detecting potential alerts, which is described in detail in this section. When PEG detects the presence of alert language, this alone does not indicate that a response is unscorable. Therefore, unless the response is unscorable for some other reason, PEG will return scores as well as the alert status code of 500 (in cases of unscorable alerts, the status code is in the range of 501-599, inclusive). Regardless of the alert flag, any responses returned with a flag to DRC will be evaluated by the handscoring supervisory team, who will determine if the response needs to be processed as an alert as described previously in this document (see Handling Unusual Responses - Alerts). When it is concluded that a response does warrant an alert, DRC Project Management will contact the LDOE with the student's LASID and post the response information to the SFTP site for LDOE's review.

PEG's Alert flagging system is a pattern-matching system, targeting phrases suggestive of violence towards self or others, drug or alcohol abuse, feelings of anxiety or depression or the use of weapons. This system is rules-based. It responds to concentrations of "alert language" detected within submissions. Typically, these are word counts of particularly violent or profane language often found in actionable alerts. (Such language may also be found in non-alert submissions, but PEG does not attempt to determine "intent" in these cases, rather it flags only the presence of detected verbiage.) PEG currently tracks two types of alert language that differ only in severity (e.g., a statement regarding a person "killing" is considered more severe than a statement regarding a person "beating up," but both are counted as forms of alert language). By default, PEG issues an alert flag if it encounters one instance of severe alert language or two instances of less-severe language. PEG may also issue an alert flag if high counts of profanity are found. By default, this is three instances of severely profane or five instances of less profane verbiage. Although this means that non-actionable alerts may also certainly be flagged, PEG's default settings are purposefully kept highly sensitive to alert language. These levels are configurable, however, so if the rate of return is too high or too low, adjustments can be made. For the responses that it cannot score, PEG returns a condition code to the test delivery system indicating why the response could not be scored (i.e., the response receives a tentative nonscore code that is reviewed by a Scoring Director and corrected if needed). The test delivery system can then route the flagged responses to DRC's performance assessment handscoring system. DRC will perform human handscoring for the limited number of responses that cannot be scored by AI.

Page 33
4.26.19 | DRC Proprietary and Confidential

With regards to the process and timing, the alerts detection is typically run in series with other essay analysis, so it is no slower (or faster) than a regular scoring. A batch of individually identified extended responses are posted to PEG's Streaming Scoring service, and at that point a response may be flagged as a potential alert. This flag takes the form of a "status code."

The rules are purposefully over-sensitive (they are more likely to give false positives than false negatives), so it is likely that the great majority of ER's flagged with a " $5 \# \#$ " status code will not require actual intervention with the student; however, PEG is in no way capable of diagnosing this. Instead PEG just follows rules designed to sense and flag the use of language which has, in the past, been associated with alerts.

## Identification of Nonscorable Responses

PEG's nonscorable configurability includes the settings listed below, which can flag responses so that they are sent to DRC Scoring Directors who will determine the correct score or nonscore code to apply. These can be set to any threshold, with extreme values effectively disabling any given setting. These are the only nonscorable parameters which can be configured in this way. Each nonscorable setting relates to status codes and general rules surrounding of insufficiency and indecipherability as described below.

1. MIN_WORDS: this controls status code 200 and may correspond to the business concept of "Insufficient" (i.e., too-short response)
2. MIN_CORRECT_WORD: this controls the status code 220 and is similar to the business concept of "Indecipherable" (i.e., foreign words and non-words)
3. Copied Text Low: this controls status code 605
4. Copied Text High: this controls status code 610

By adjusting each setting, PEG may impose a reasonable approximation of the scoring rules regarding Insufficiency and/or Indecipherability.

Once the scoring in the cloud is complete, the scores and statuses are sent back to the MI Delivery Service which then returns these scores and codes to DRC.

That entire process typically requires less than 100 hours ( $\sim 4$ days), and quite often takes less than a single day).

## Identifying Copied Text and Plagiarism with the AI Engine

Prior to describing the functionality PEG uses to detect copied text and plagiarized responses, an important distinction must be made between what is considered copied and what is considered plagiarized. Copied text is that which a student copies from the directions, prompt, passage(s), or reference sources supplied with an item. A response composed predominantly of text copied from item sources will not be alerted for any sort of suspected testing violation, but in most cases, it will receive a lower score (or a nonscore of " $l$ ") depending on the amount of original student writing in the response and/or how much text is copied. Responses flagged by PEG for this condition are sent to DRC scoring supervisors for review. Based on this review, EOC English III responses having an insufficient amount of
original writing to score will receive a nonscore of "I." For LEAP 2025 U.S. History and grades 5-8 Social Studies ERs, any response having an insufficient amount of original writing to score, because it is made up entirely or almost entirely of text copied from the directions or reference sources, will also receive a score of " $I$ " (unless the item-specific rubric makes exceptions for the use of relevant copied text).

Text that a student extracts and uses from a source external to the test itself is considered plagiarized. When PEG detects these responses (this process is explained in the next paragraph), they are also sent to DRC scoring supervisors for review, and if they are deemed to warrant an alert for suspected plagiarism, DRC's supervisors route the responses through the same alert process described in an earlier section of this document (Handling Unusual Responses - Alerts).

PEG's copied text and plagiarism detection functionality compares student responses to texts that students may have copied or plagiarized. To do this, per-item reference texts must be provided. For EOC English III, this is the prompt and any associated reading material provided with each test item. For the LEAP 2025 U.S. History and grades 5-8 Social Studies ERs, this includes the prompt and any associated source material (including MC/MS items) provided with each test item. In addition to external sources of plagiarism previously provided by LDOE based on results from past administrations, DRC will pre-identify other websites that may be likely sources of external plagiarism. These may include Wikipedia's pages relevant to the topic and/or other "top hit" websites. These external sources will be used by the AI engine to identify potentially plagiarized responses. All of these text references will be added to the appropriate scoring models for each related item.

Upon receiving a response, PEG conducts a high-speed sequence scan of both the reference text and the response. Each sequence is evaluated for both the length and density of copied/plagiarized text. Length is a direct character count, and density is a measure of similarity between sequences. A verbatim copy has a density of 1.0 , and a copy that contains some substitutions, additions, or deletions would likely have a density in the $\sim 0.6-0.4$ range. The product of these two numbers provides a value that is used to flag responses requiring human review due to large amounts of copied/plagiarized text. Clients can configure two thresholds for a low and high flag. For example, the default values for these are 50 and 100 respectively. So, a verbatim copy of 72 characters ( $\sim 12$ prompt words) would be reported as a low match, whereas a verbatim copy of 100 characters (roughly 16 words) would be flagged as a high match. Similarly, a copy (even with some substitutions) of 40 words would still be reported as a high match in the default setting example. The low and high matches will be flagged with status codes. This is similar to the alert flagging above. There will be a three-digit code for low-match (status code 605) and a threedigit code for high-match (status code 610).

Custom thresholds for copied text, plagiarism, and insufficient responses have been established by DRC in consultation with LDOE and were based on recommendations from MI. They are described below:

1. When PEG scans responses for copied text/plagiarism, any text copied from the supplied reference texts (regardless of whether it is contained within quotations marks) will be considered when determining if a response meets or exceeds the thresholds required for it to be routed to DRC for human review. These configurations are noted in 2a-4b on page 36.

Page 35
4.26.19 | DRC Proprietary and Confidential

## 2. EOC English III

a. Copied text thresholds
i. Low flag (status 605) $\mathbf{- 1 2 5}$ characters
ii. High flag (status 610) - 200 characters
b. MIN_WORDS (status 200) -45 words or fewer
3. LEAP 2025 Grades $5-8$ Social Studies
a. Copied text thresholds
i. Low flag (status 605) $\mathbf{- 1 2 5}$ characters
ii. High flag (status 610) - 200 characters
b. MIN_WORDS (status 200) - 25 words or fewer
4. LEAP 2025 U.S. History
a. Copied/plagiarized text thresholds
i. Low flag (status 605) - 85 characters
ii. High flag (status 610) - 170 characters
b. MIN_WORDS (status 200) - 25 words or fewer

These settings are deliberately conservative. While some flagged responses are composed exclusively of text copied directly from source/passage material, the majority of responses that PEG flags with status codes 605 and 610 contain a combination of copied text, relevant information cited or paraphrased from the sources, and some amount of original student writing. They are flagged because they meet or exceed the copied text thresholds noted above and need to be checked by DRC scoring supervisors to determine whether they contain a sufficient amount of original student writing to evaluate. Upon review, most will be found to contain enough original writing to be considered scorable. When the supervisor determines that there is sufficient original student writing to score, and there is no evidence of plagiarism, he or she validates the original numeric scores returned by PEG and they are submitted as final scores for that response. On the other hand, if the supervisor determines that the response contains insufficient original student writing to evaluate, he or she will override PEG's scores and apply the appropriate scores or nonscores as necessary, depending on the content area scoring rules. For EOC English III and LEAP 2025 U.S. History and Social Studies, flagged responses composed entirely of text copied from item source material (or copied text combined with an insufficient amount of original student work) are given a nonscore of "I" (Insufficient).

Less frequently, responses will be flagged as potential nonscores for having too little written to be evaluated at all (status code 200). Just as DRC requires all nonscores given by human readers to be reviewed by scoring supervisors, this same requirement holds true when PEG flags responses as potential nonscores. For example, if the DRC supervisor reviews a response flagged by PEG and agrees with PEG's assessment that the response has too little writing to be assessed, the supervisor will validate the AI score of "I," and this nonscore code will be submitted as the final score for that response. On the other hand, if DRC's supervisor reviews the response, and based on the training responses provided in the handscoring training materials, he or she feels that that there is enough original student writing to score, the supervisor scores the response and also overrides PEG's original nonscore, changing PEG's nonscore of " $I$ " to the correct numeric scores. These become the scores of record.

## Al Scoring - Pearson

The items in the following table will be AI scored by Pearson during the Spring 2019 LEAP 2025 administration. Al scoring models for each of these items were previously built and used by Pearson during PARCC operational scoring. (Model-building data for all items included on the Spring 2019 test may be found in the Appendix.)

| Course | Task <br> Type | IDEAS ID | PARCC UIN | Model Built |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |
|  |  |  |  |  |
| English I | LAT | 902152 | VH017536_2T | 2017 |
| English I | RST | 914552 | GG431834057 | 2018 |
|  |  |  |  |  |
| English II | LAT | 906197 | HH428127697 | 2017 |
| English II | NWT | 983642 | HH432845949 | 2017 |
| Grade 6 ELA | RST | 913715 | DD502035970 | 2017 |
| Grade 6 ELA | NWT | 913694 | D1466 | 2017 |
| Grade 7 ELA | NWT | 913842 | EE430133306 | 2017 |
| Grade 8 ELA | LAT | 913958 | F1460 | 2017 |

## The Intelligent Essay Assessor

Pearson's Intelligent Essay Assessor (IEA) uses a range of machine learning and natural language processing technologies to learn to score based on human-scored responses. One of the hallmarks of IEA is its ability to score constructed responses in content domains using Pearson's unique implementation of Latent Semantic Analysis (LSA), an approach that generates semantic similarity of words and passages by analyzing large bodies of relevant text. LSA can then "understand" the meaning of text much the same as a human scorer.

IEA's background knowledge of English is derived from a collection of texts equivalent to what students are likely to have encountered over the course of their academic career (about 12 million words). Because LSA operates over the semantic representation of texts, rather than at the individual word level, it can evaluate similarity even when texts have few words in common. For example, LSA finds the following two sentences to have a high degree of semantic similarity:

- Surgery is often performed by a team of doctors.
- On many occasions, several physicians are involved in an operation.

The following figure illustrates some of the features used in IEA and how they relate to specific constructs of student writing performance.

Example features used in the Intelligent Essay Assessor. Like human scorers, IEA evaluates essays for ideas, organization, development, and various grammatical and mechanics errors.

IEA is trained to associate features extracted from each essay with scores assigned by human scorers. A machine learning-based approach is used to determine the optimal set of features, and the weights for each of those features, to best model the scores for each essay. From these comparisons, IEA derives a prompt- and trait-specific scoring model that predicts the scores human scorers would assign to any new responses.

The automated scoring process mimics the approach that human scorers take when evaluating essays. Human scorers train based on anchors of annotated student responses with agreed-upon scores. Human scorers compare new responses against the anchor set of two to three examples per score point to determine the appropriate score. IEA scores essays similarly, but makes comparisons against a much larger set of examples. Rather than comparing a new essay against the 16-24 examples in an anchor set, it compares against the set of hundreds or thousands of responses on which it was trained.

## How the Intelligent Essay Assessor was Trained

For the ELA prompts that will be used by Louisiana, IEA was trained based on operational PARCC responses using Pearson's Continuous Flow approach to training and scoring. When these prompts were first administered, student responses flowed to IEA even before human scoring started. IEA then selected a sample of responses for humans to score first to expedite the creation of automated scoring models. The sample included responses that represented different demographic subgroups to ensure
equity in scoring, as well as responses that were algorithmically selected to likely span the score range. As the human-scored responses flowed back to IEA, the engine automatically built potential scoring models, evaluating them against the industry standards for performance criteria included in the table below.

| Evaluation of Automated Scoring Systems |  |
| :--- | :--- |
| Criterion | Threshold |
| Quadratic weighted kappa (QWK) | Greater than or equal to 0.70 |
| Pearson correlation (r) | Greater than or equal to 0.70 |
| Standardized mean difference (SMD) between human and <br> automated scoring | Less than or equal tol0.15। |
| Difference in QWK or r from human-human rates | Less than or equal to 0.10 |
| Difference in exact agreement from human-human rates | Less than or equal to 0.05 |

Evaluating Automated Scoring. Statistical Criteria for the Evaluation of Automated Scoring Systems based on those used by Williamson et al, Smarter Balanced, and PARCC.

While the engine was being trained, scoring and psychometrics teams met daily to review progress, quality, and next steps. When IEA met or exceeded the performance criteria for a given constructed response item, it took over as the first scorer for that item.

Responses for which IEA is less confident in its score are routed for additional human scoring. This "smart routing" of responses by the scoring engine occurs when responses fall in a particular score range for which the engine has lower agreement with human scorers, or for responses that are highly unusual or creative.

The figure on the following page depicts the entire Continuous Flow process.

## Continuous Flow Scoring

Continuous Flow. As student responses flowed to IEA, it selected responses for human scorers to score. As the human scores flowed back to IEA, the engine continued to try to build a scoring model that would pass the agreed upon performance criteria. Once the scoring model passed the criteria, it was deployed and began scoring all student responses, with humans applying a second score as a quality check, as well as scoring any responses flagged for review by IEA.

IEA is also trained to recognize a variety of different non-responses (e.g., non-English language, "don't understand," refusal to answer, off-topic, unintelligible), assigning corresponding condition codes to them or flagging them for human review when less certain. Detection of copying between students is done out of band and accomplished by using Latent Semantic Analysis to compare each student response to every other student response and flagging highly similar responses for human review. The comparison is cumulative. Every response gets checked against every other response that has been received, as they come in, within that same administration and within that prompt. Child in danger alerts are also scanned for out of band and flagged for human review.

## Quality Monitoring

Human scorers play a key role in maintaining quality throughout the scoring process starting with IEA learning to score based on their scores. Since the models for the 2019 Louisiana items are built and IEA has already established the performance characteristics necessary to accomplish first scoring, DRC human scorers will score $10 \%$ of the responses scored by IEA to monitor quality. Should agreement rates between IEA and the human scorers fall below the established agreement rates, the automated scoring model can be examined to determine the appropriate action. This action may include adjusting IEA's confidence threshold to send more responses for human scoring or retraining the scoring engine and
rescoring student responses.

## Scoring (DRC)

DRC will use human scorers to read behind MI and Pearson's AI engines. Ten percent of the AI-scored student responses will be randomly selected to be read a second time by DRC's handscoring teams. This will provide inter-rater reliability statistics that compare the scores given by PEG and IEA to the scores given by each individual reader. Throughout the handscoring process, DRC Project Managers, Scoring Directors, and Team Leaders will review handscoring reports detailing these results.

If the inter-rater reliability (AI compared to handscoring on the $10 \%$ sample) shows exact agreement that is less than desired or nonadjacent agreement that is higher than desired, DRC will investigate and take immediate action. If scoring patterns are apparent among individual readers, scoring supervisors will deal with issues of this sort on an individual basis. If a reader appears to need clarification of the scoring rules, DRC supervisors typically monitor one out of five of the scorer's readings, making adjustments to that ratio as needed. If a supervisor disagrees with a reader's scores during monitoring, he or she will provide retraining in the form of direct feedback to the reader, using rubric language and applicable training responses.

If, however, the agreement rates for either PEG or IEA and for large numbers of readers are not as anticipated, DRC scoring experts will need to review the responses that received different scores from the Al engine(s) and from readers. Based on this, the DRC scoring experts will need to determine if they feel that the readers need to be retrained or if they are disagreeing with scores given by AI. In the unlikely scenario that DRC's scoring experts believe that they have detected unexpected trends in the scores given by PEG or IEA, DRC would take examples to LDOE and the appropriate AI vendor to review. Based on this review, if DRC, LDOE, and the vendor determined that the AI modelling was not resulting in sufficiently accurate scores, corrective measures would be put into place. Depending on the nature and timing of the issue and subsequent related LDOE policy decisions, DRC and the AI vendor will enact measures such as updating the AI modeling, providing LDOE with response information (e.g., Item ID, Student IDs, updated scale scores, updated achievement levels), and/or using expert handscorers to determine the final score for student responses.

## Rescores

The rescoring process includes automatic rescores that occur during the scoring process, as well as parent-requested rescores that take place after the official scoring window. The rescores for all subjects will be performed by expert readers.

Please refer to LEAP 2025 HS_EOC Processing Rules - Scoring.pdf on the LDOE Reporting SFTP site at /<YYYY> - EOC LEAP 2025 HS <Spring>/Processing Rules - Final/ for a complete description of the rescore rules and process.

## Appendix A

## DRC-MI Streaming Scoring Documentation

## DRC - MI STREAMING SCORING SUBMIT SERVICE DOCUMENTATION

NOTICE: The contents of this document and any references to external resources are intended for review only by representatives of Data Recognition Corporation, Measurement Incorporated, and LDOE, and are considered private. Technical specifications are subject to change.

REVISED: 2015-11-23; created

## CONTENTS:

SECTION 1 - General Information 43
SECTION 2 - SCHEMA SUPPLEMENT 44-46
SECTION 3 - STATUS CODE INFORMATION 47

Page 42
1.1 PURPOSE: Submit Service accepts groups ("batches") of constructed responses for processing by the MI Streaming Scoring product.
1.2 SERVICE TYPE: The Submit Service use a standard SOAP web service interface.
1.3 INTEGRATION: Application-generated service definition (WSDL 1.1) document is available; WCF (Windows Community Foundation) client integration is also possible. The WSDL and WCF URLs for each environment are as follows:

## DEVELOPMENT

- WSDL:
- WCF:

## STAGING

- WSDL:
- WCF:

PRODUCTION:

- WSDL:
- WCF:
1.4 SERVICE SIGNATURE: The Submit Service provides a single operation SubmitBatch. The operation signature - request and response structure - is defined in the WSDL. The structure of each complex type, with field descriptions and expected value ranges is described below.
2.1.1 SUPPLEMENTAL SCHEMA DOCUMENTATION: The following tables are supplemental to the schema for the Submit Service, but are not, themselves, the schema. The service schema is contained within the WSDL, and may be emitted from that source to an XML schema document (XSD) through various means, though this will likely be unnecessary. To reduce confusion in terminology, the following tables will be referred to as the "supplement" or "schema supplement".
2.1.2 TABLE STRUCTURE: Each table documents a specific complex type defined by the Submit Service WSDL, with each row in a table representing a field of that complex type. Column definitions are provided here.
- Name: Name of field; note that for complex type fields, the name of the field and the name of the type may, or may not be the same.
- Type: Field type; this may be a simple type (string, integer, etc.) or another complex type, which is described in another table.
- Min: Minimum expected occurrences (minOccurs). This value with be either 1 or 0 for all fields. For fields with 0 minOccurs, that field may be omitted from the complex type, and it will still be schema-compliant. Omitting a field may still cause an application-level error due to invalid data, refer to the Range column for application-level constraints.
- Max: Maximum expected occurrences (maxOccurs). This value will usually be 1 or unbounded. Unbounded fields/elements may appear multiple time within the complex type, which allows for list-like data structures within the service. While there is no theoretical upper limit to the number of occurrences, some constraints are enforced at the application level. See the Range column for more information.
- Description: This column defines the field's purpose.
- Range: Application-enforced constraints on a field's value are given here. If the field has a minOccurs of 0 in the schema, but is expected to be included by the application, it will be designated required in this column. Fields with a maxOccurs of unbounded within the schema with an application-enforced limit will be described here. Strings will have their maximum expected length defined here, if any.

### 2.2.3 ConstructedResponse

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :--- | :--- |
| EssayText | string | 1 | 1 | Student-generated response text. | This field is technically nillable, though nil or zero-length essays will not be <br> scored. The field also technically has no max length, but essays exceeding <br> 30,000 characters will also not be scored. Description codes will be returned for <br> each of these cases. |
| ItemId | string | 1 | 1 | Identifier for Item/prompt | Responses that do not have a valid ItemId will not be scored; the range and <br> convention for ItemIds are defined by DRC and MI. |
| Responseld | string | 1 | 1 | DRC constructed response ID; no <br> validation performed by MI | Max length 256; longer values will be truncated. |

2.3.1 SubmitBatchResponse (RESPONSE ELEMENT)

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :---: | :--- | :--- |
| SubmitBatchResult | SubmitBatchResult | 0 | 1 | Application-defined result element | Required. |

### 2.3.2 SubmitBatchResult

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :--- | :--- |
| Batchld | string | 1 | 1 | DRC batch ID as stored by MI (same <br> value given in request) | Value may be truncated if it exceeds 50 characters |
| Clientld | string | 1 | 1 | MI-assigned client identifier (same value <br> given in request) |  |
| MIBatchId | ser:guid | 1 | 1 | MI-generated Batch ID |  |
| StatusCode | StatusCode | 1 | 1 | Application-generated response code <br> indicating success/failure of operation | ser:guid is an extension of string, bounding the expected value to a Guid <br> data type. It may be treated as a string or parsed to a Guid by the client. |

### 2.3.3 StatusCode

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :--- | :--- |
| Code | integer | 0 | 1 | Numeric status code | Required. Will fall in the range 0-999. See section 3 for more information |
| Description | string | 0 | 1 | Short description of status | Required. See section 3 for more information |

## SECTION 3 - STATUS CODE INFORMATION

3.1 STATUS CODES: Each SubmitBatch response will contain a status code indicating success or failure in adding the batch to the Streaming Scoring system. Individual CRs processed by Streaming Scoring will also receive similarly structured Status Codes upon delivery, albeit with similar values. Note that lowerlevel errors will not receive application-generated responses, and therefore will not be given status codes. These types of errors include (but are not limited to): malformed requests (which violate the schema), service unavailable, and TCP/HTTP errors. Expected status codes and their description for the SubmitBatch operation can be found in the following table.

### 3.2 SubmitBatch STATUS CODES

| Code | Description | Notes |
| :--- | :--- | :--- |
| 0 | SUCCESS | Batch successfully accepted and queued for scoring. |
| 100 | INVALID_CLIENT_ID | Clientld value in request is not valid. |
| 120 | NO_REQUEST_DATA | request element is nil or missing. |
| 140 | NO_ESSAY_DATA | ConstructedResponses element is missing or contains zero CRs. |
| 150 | BATCH_TOO_LARGE | ConstructedResponses element contains more than 2000 CRs. |
| 190 | INTERNAL_ERROR | An unexpected internal error occurred at the application level. |

### 3.3 Individual CR STATUS CODES

| Code | Description | Notes |
| :--- | :--- | :--- |
| 200 | too few words (configurable) | blank or extremely short response; response sent to DRC for <br> Supervisor Review |
| 220 | not enough correctly spelled words <br> (configurable) | "Indecipherable" (i.e., foreign words and non-words); response sent to <br> DRC for Supervisor Review |
| 400 | unexpected item_id | the item_id is not one of the items PEG AI has modeled; potential set- <br> up issue to be resolved between MI and DRC |
| 500 | Alert, otherwise same as 0, above | alerted response sent to DRC for Supervisor Review |

Human to human metrics are from DRC EFT scoring in Spring 2017.
Al to human metrics are from the MI 2017 model-building results.

- Al model was built in Fall 2017
- Included 2,500 responses from the Spring 2017 EFT
- Responses scored using DRC developed training materials
- $100 \%$ were scored by a second human reader and adjacent scores were resolved

## Al Model Building - Social Studies Grades 5-8 ERs (Spring 2019)

H to $\mathrm{H}^{1}$ - Human scored 2016 Field Test sample of $\approx 2500$ responses per item.
$H$ to $\mathrm{H}^{2}, \mathrm{H}$ to $\mathrm{H}^{3}$ - Human scored targeted samples of $\approx 500$ responses per item used to augment and retrain the original Al models from 2016 . These samples come from spring operational responses and are intended to find high score points to add to the existing Al models for the purpose of retraining the models prior to operational scoring. H to $\mathrm{H}^{2}$ augmentation sample was scored in spring 2017. H to H3 augmentation sample is to be scored in spring 2019.
AI - Data based on holdout subsets chosen by stratified random sampling from the full $\approx 3000$ per item response count (2016 FT and 2018 sample) and excluded from the training process.

Form Key: Forms D and E = Operational, Form A =Seniors only, Form C = Administrative Error (AE)

* Handscored by DRC in Fall of 2017
** Pearson - Statistics from 2017 and 2016 are included for $902331 / \mathrm{VH} 004490$. Volumes were significantly higher in 2016, but reports in 2016 did not split out human and AI scoring, so the 2016 and 2017 column headers are different.

Zwick, R., Donoghue, J. R., \& Grima, A. (1993). Assessment of differential item functioning for performance tasks. Journal of Educational Measurement, 30(3), 233-251.

[^0]:    * Six Embedded Field Test Items were included throughout the assessment; they are included in the total time.

[^1]:    * Six Embedded Field Test Items were included throughout the assessment; they are included in the total time.

[^2]:    ${ }^{1}$ Item associations were determined by PARCC/Pearson with the understanding that aspects of training are generalizable across
    similar items. For mathematics, the determination of prototype versus abbreviated items was made by PARCC and Pearson based on similar item types and evidence statements. For ELA items, this determination by PARCC and Pearson was based on grade and task type.

[^3]:    *For the ELA Knowledge and Use of Language Conventions trait, there were two mixed-prompt anchor sets per grade level (one for the narrative task and the other for the literary analysis and research simulation tasks). In addition to the mixed-prompt anchor set, depending on the task, the practice sets for prototype and abbreviated items required readers to practice scoring the Knowledge and Use of Language Conventions trait along with the Reading Comprehension and Written Expression trait (for LAT and RST items) or with the Written Expression trait (NWT). Readers were also required to qualify on the Knowledge and Use of Language Conventions trait during each prototype item qualifying session.
    **These PARCC-approved sets provided additional annotated sample responses explaining the scoring rationale for responses composed entirely or partially of text copied from the source passage(s) associated with an item. DRC scoring supervisors reviewed these item-specific sets with the readers prior to scoring the associated item.

[^4]:    * Grade 9 includes the grade that is coded as "Т9."

[^5]:    * Grade 9 includes the grade that is coded as " T 9. .

[^6]:    * Senior form

[^7]:    * Senior form

[^8]:    * Senior form

[^9]:    *The count of observations in the analysis is in parenthesis

[^10]:    Social Studies Grade 8

[^11]:    *In spring 2017, human scored targeted samples of $\approx 500$ responses per item used to augment and retrain the original Al models built in 2016. These samples were intended to find high score points to add to the existing Al models for the purpose of retraining the models prior to operational scoring in spring 2017.
    **Similarly, the original 2016 model for grade 5 ER 807773 will be augmented prior to operational scoring in spring 2019 using a targeted sample of spring 2019 responses.

[^12]:    ${ }^{2}$ PEG's agreements are based on a hold-out validation set pattern, as opposed to a cross-validation pattern. Crossvalidation was evaluated in the past, but MI has since learned that hold-out validation provides (1) equally valid models with a massive improvement in training time, as well as (2) an easy way to ensure that the validation set remains partitioned from the rest of the training set at all times.
